

SCIENCE PASSION TECHNOLOGY

Architecture of ML Systems 10 Model Selection & Management

Matthias Boehm

Graz University of Technology, Austria Computer Science and Biomedical Engineering Institute of Interactive Systems and Data Science BMK endowed chair for Data Management

Announcements/Org

- #1 Video Recording
 - Link in TeachCenter & TUbe (lectures will be public)
 - Hybrid: HS i5 / <u>https://tugraz.webex.com/meet/m.boehm</u>
 - Apr 25: no more COVID restrictions at TU Graz

#2 Projects and Oral Exams

- Precondition: completed exercise/project by Jun 17 EOD
- Created doodle for exam slot selection (~ 14/35): <u>https://doodle.com/meeting/participate/id/eER4P10a</u>

#3 Course Evaluation

Please participate; open period: June 1 – July 15

Data Science Lifecycle

ISDS

Agenda

- Data Augmentation
- Model Selection Techniques
- Model Management & Provenance

Data Augmentation

6

Motivation and Basic Data Augmentation

Motivation Data Augmentation

- Complex ML models / deep NNs need lots of labeled data to avoid overfitting **>** expensive
- Augment training data by synthetic labeled data

Translations & Reflections

- Random 224x224 patches and their reflections (from 256x256 images with known labels)
- Increased data by 2048x
- Test: corner/center patches + reflections \rightarrow prediction

Alternating Intensities

- **Intuition:** object identity is invariant to illumination and color intensity
- PCA on dataset \rightarrow add eigenvalues times a random variable N(0,0.1)

706.550 Architecture of Machine Learning Systems – 10 Model Selection and Management Matthias Boehm, Graz University of Technology, SS 2022

AlexNet

[Alex Krizhevsky, Ilya Sutskever, Geoffrey E. Hinton: ImageNet Classification with **Deep Convolutional Neural** Networks. NIPS 2012]

Basic Data Augmentation

- Scaling and Normalization
 - Standardization: subtract per-channel global pixel means
 - Normalization: normalized to range [-1,1] (see min-max)
- General Principles
 - #1: Movement/selection (translation, rotation, reflection, cropping)
 - #2: Distortions (stretching, shearing, lens distortions, color)
 - In many different combinations → often trial & error / domain expertise

Excursus: Reducing Training Time

- Transfer learning: Use pre-trained model on ImageNet; freeze lower NN layers, fine-tune last layers w/ domain-specific data
- Multi-scale learning: Use cropping and scaling to train 256 x 256 model as starting point for a more compute-intensive 384x384 model

[Karen Simonyan, Andrew Zisserman: Very Deep Convolutional Networks for Large-Scale Image Recognition. ICLR 2015]

Basic Data Augmentation, cont.

Learning Data Augmentation Policies

Bachelor Thesis David Woergoetter

AutoAugment

- Search space of DA policies
- Goal: Find best augmentation policy (e.g., via reinforcement learning)
- #1: Image processing functions (translation, rotation, color normalization)
- #2: Probabilities of applying these functions

Data Augmentation GAN (DAGAN)

- Image-conditional generative model for creating within-class images from inputs
- No need for known invariants

10 Model **Selection &** Management

11 Model Debugging **Techniques**

Effects of Augmentation

- **#1** Regularization for reduced generalization error, not always training error (penalization of model complexity)
- **#2** Invariance increase by averaging features of augmented data points
- Data Augmentation as a Kernel
 - Kernel metric for augmentation selection
 - Affine transforms on approx. kernel features

[Tri Dao et al: A Kernel Theory of Modern Data Augmentation. ICML 2019]

Model Selection Techniques

AutoML Overview

- #1 Model Selection
 - Given a dataset and ML task (e.g., classification or regression)
 - Select the model (type) that performs best (e.g.: LogReg, Naïve Bayes, SVM, Decision Tree, Random Forest, DNN)
- #2 Hyper Parameter Tuning
 - Given a model and dataset,
 A^(j)∈*A*,λ∈Λ^(j) *k* ∠ *i*=1
 find best hyper parameter values
 (e.g., learning rate, regularization, kernels, kernel parameters, tree params)

Validation: Generalization Error

- Goodness of fit to held-out data (e.g., 80-20 train/test)
- Cross validation (e.g., leave one out → k=5 runs w/ 80-20 train/test)

AutoML Systems/Services

- Often providing both model selection and hyper parameter search
- Integrated ML system, often in distributed/cloud environments

[Chris Thornton, Frank Hutter, Holger H. Hoos, Kevin Leyton-Brown: Auto-WEKA: combined selection and hyperparameter optimization of classification algorithms. **KDD 2013**]

$$A^* \in \operatorname*{argmin}_{A \in \mathcal{A}} \frac{1}{k} \sum_{i=1}^k \mathcal{L}(A, \mathcal{D}_{\mathrm{train}}^{(i)}, \mathcal{D}_{\mathrm{valid}}^{(i)}),$$

$$A^*_{\lambda^*} \in \operatorname*{argmin}_{A^{(j)} \in \mathcal{A}, \lambda \in \Lambda^{(j)}} \frac{1}{k} \sum_{i=1}^k \mathcal{L}(A^{(j)}_{\lambda}, \mathcal{D}^{(i)}_{\text{train}}, \mathcal{D}^{(i)}_{\text{valid}}).$$

15

16

Basic Grid Search

- **Basic Approach**
 - Given n hyper parameters $\lambda 1$, ..., λn with domains $\Lambda 1$, ..., Λn
 - Enumerate and evaluate parameter space $\Lambda \subseteq \Lambda_1 \times ... \times \Lambda_n$ (often strict subset due to dependency structure of parameters)
 - Continuous hyper parameters \rightarrow discretization
 - Equi-width
 - Exponential (e.g., regularization 0.1, 0.01, 0.001, etc)
 - Problem: Only applicable with small domains
- Heuristic: Monte-Carlo (random search, anytime)

GridSearchCV()

Accuracy (%): 82.35

Accuracy (%): 84.73

Accuracy (%): 90.07

- **Example Adult Dataset** (train 32,561 x 14)
 - Binary classification (>50K), https://archive.ics.uci.edu/ml/datasets/adult
 - #1 MLogReg defaults w/ one-hot categoricals
 - #2 MLogReg defaults w/ one-hot + binning
 - #3 GridSearch MLogReg:

```
params = list("icpt", "reg", "numBins");
paramRanges = list(seq(0,2), 10^{seq}(3,-6), 10^{seq}(1,4));
```

 Example SystemDS gridSearch 	45 46 47 48 49	<pre>HP = matrix(0, numConfigs, numParams); parfor(i in 1:nrow(HP)) { for(j in 1:numParams) # Materialize Configs HP[i,j] = paramVals[j,as.scalar(((i-1)/cumLens[j,1])%paramLens[j,1]+1)]; }</pre>
05 Data- and Task- Parallel Execution	61 62 63 64 65 66 67 68 69 70	<pre>parfor(i in 1:nrow(HP)) { # a) replace training arguments largs = trainArgs; for(j in 1:numParams) largs[as.scalar(params[j])] = as.scalar(HP[i,j]); # b) core training/scoring and write-back lbeta = t(eval(train, largs)) Rbeta[i,1:ncol(lbeta)] = lbeta; Rloss[i,] = eval(predict, list(X, y, t(lbeta))); }</pre>

Basic Iterative Algorithms

- Simulated Annealing
 - Decaying temperature schedules: $T_{k+1} = \alpha \cdot T_k$
 - #1 Generate neighbor in ε-env of old point
 - #2 Accept better points and worse points w/

Exploration vs exploitation

$$(T_k) = \frac{1}{1 + \exp((f' - f)/T_k)}$$

Recursive Random Search

- Repeated restart
- Sample and evaluate points
- Determine best and shrink area if optimum unchanged
- Realign area if new optimum found

	it for any factor that the state of a particular

P

Bayesian Optimization

- Overview BO
 - Sequential Model-Based Optimization
 - Fit a probabilistic model based on the first n-1 evaluated hyper parameters
 - Use model to select next candidate
 - Gaussian process (GP) models, or tree-based Bayesian Optimization

Underlying Foundations

- The posterior probability of a model M given evidence E is proportional to the likelihood of E given M multiplied by prior probability of M
- Prior knowledge: e.g., smoothness, noise-free
- Maximize acquisition function: GP high objective (exploitation) and high prediction uncertainty (exploration)

Algorithm 1 SMBO

- 1: initialise model \mathcal{M}_L ; $\mathcal{H} \leftarrow \emptyset$
- 2: while time budget for optimization has not been exhausted do

classification algorithms. KDD 2013]

3: $\boldsymbol{\lambda} \leftarrow \text{candidate configuration from } \mathcal{M}_L$

[Chris Thornton, Frank Hutter, Holger H. Hoos, Kevin Leyton-Brown: Auto-WEKA: combined selection and hyperparameter optimization of

- 4: Compute $c = \mathcal{L}(A_{\lambda}, \mathcal{D}_{\text{train}}^{(i)}, \mathcal{D}_{\text{valid}}^{(i)})$
- 5: $\mathcal{H} \leftarrow \mathcal{H} \cup \{(\boldsymbol{\lambda}, c)\}$

6: Update
$$\mathcal{M}_L$$
 given \mathcal{H}

- 7: end while
- 8: return $\boldsymbol{\lambda}$ from \mathcal{H} with minimal c

Multi-armed Bandits and Hyperband

- Overview Multi-armed Bandits
 - Motivation: model types have different quality
 - Select among k model types → k-armed bandit problem
 - Running score for each arm → scheduling policy

[Sébastien Bubeck, Nicolò Cesa-Bianchi: Regret Analysis of Stochastic and Nonstochastic Multi-armed Bandit Problems. Foundations and Trends in Machine Learning 2012]

Hyperband

- Non-stochastic setting, without parametric assumptions
- Pure exploration algorithm for infinite-armed bandits
- Based on Successive Halving
 - Successively discarding the worst-performing half of arms
- [Lisha Li, Kevin G. Jamieson, Giulia DeSalvo, Afshin Rostamizadeh, Ameet Talwalkar: Hyperband: A Novel Bandit-Based Approach to Hyperparameter Optimization. JMLR 2017]

Neural Architecture Search

Motivation

24

- Design neural networks (type of layers / network) is often trial & error process
- Accuracy vs necessary computation characterizes an architecture
- → Automatic neural architecture search

#1 Search Space of Building Blocks

- Define possible operations (e.g., identity, 3x3/5x5 separable convolution, avg/max pooling)
- Define approach for connecting operations (pick 2 inputs, apply op, and add results)

1944.1

Neural Architecture Search, cont.

#2 Search Strategy

- Classical evolutionary algorithms
- Recurrent neural networks (e.g., LSTM)
- Bayesian optimization (with special distance metric)

#3 Optimization Objective

- Max accuracy (min error)
- Multi-objective (accuracy and runtime)

Excursus: Model Scaling

- Automatically scale-up small model for better accuracy
- EfficientNet

[Mingxing Tan, Quoc V. Le: EfficientNet: Rethinking Model Scaling for Convolutional Neural Networks. **ICML 2019**] [Barret Zoph, Quoc V. Le: Neural Architecture Search with Reinforcement Learning. ICLR 2017]

Model Management & Provenance

Overview Model Management

- Motivation
 - Exploratory data science process → trial and error (preparation, feature engineering, model selection)
 - Different personas (data engineer, ML expert, devops)

Problems

- No record of experiments, insights lost along the way
- Difficult to reproduce results
- Cannot search for or query models
- Difficult to collaborate

Overview

- Experiment tracking and visualization
- Coarse-grained ML pipeline provenance and versioning
- Fine-grained data provenance (data-/ops-oriented)

How did you create that model? Did you consider X?

[Manasi Vartak: ModelDB: A system to manage machine learning models, Spark Summit 2017]

Model Management Systems (MLOps)

- ModelHub
 - Versioning system for DNN models, including provenance tracking
 - DSL for model exploration and enumeration queries (model selection + hyper parameters)
 - Model versions stored as deltas

■ ModelDB → Verta.ai

- Model and provenance logging for ML pipelines via programmatic APIs
- Support for different ML systems (e.g., spark.ml, scikit-learn, others)
- GUIs for capturing meta data and metric visualization

[Manasi Vartak, Samuel Madden: MODELDB: Opportunities and Challenges in Managing Machine Learning Models. IEEE Data Eng. Bull. 2018]

[Verta Enterprise

MLOps Platform https://www.verta.ai/ platform/]

Lineage Tracing and Reuse in Machine

38

Lineage Tracing & Reuse in SystemDS

Multi-level, Lineage-based Reuse

- Lineage trace uniquely identifies intermediates
- Reuse intermediates at function / block / operation level

Full Reuse of Intermediates

- Before executing instruction, probe output lineage in cache Map<Lineage, MatrixBlock>
- Cost-based/heuristic caching and eviction decisions (compiler-assisted)

Partial Reuse of Intermediates

- Problem: Often partial result overlap
- Reuse partial results via dedicated rewrites (compensation plans)
- Example: steplm

for(i in 1:numModels)
R[,i] = lm(X, y, lambda[i,], ...)

m_lmDS = function(...) {
 l = matrix(reg,ncol(X),1)
 A = t(X) %*% X + diag(1)
 b = t(X) %*% y
 beta = solve(A, b) ...}

Х

t(X)
