

Data Management 07 Physical Design & Tuning

Matthias Boehm

Last update: Dec 10, 2019

Graz University of Technology, Austria
Computer Science and Biomedical Engineering
Institute of Interactive Systems and Data Science
BMVIT endowed chair for Data Management

Announcements/Org

#1 Video Recording

Link in TeachCenter & TUbe (lectures will be public)

#2 Statistics Exercise 1

All submissions accepted (submitted/draft)

74.7%

■ In progress of grading → Nov 26

#3 Exercise 2

- Deadline Nov 26 11.59pm
- Office hours Mo 3pm (Inf 13/V) and Nov 20 5.30pm (Inf 16c)

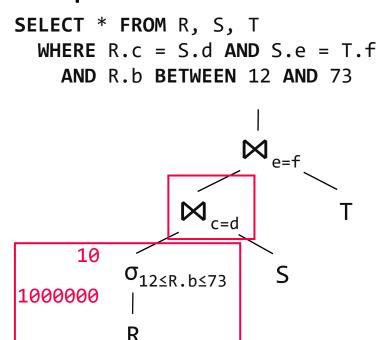

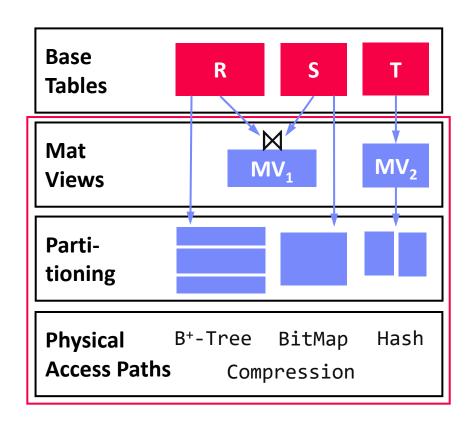

Physical Design, and why should I care?

Performance Tuning via Physical Design

- Select physical data structures for relational schema and query workload
- #1: User-level, manual physical design by DBA (database administrator)
- #2: User/system-level automatic physical design via advisor tools

Example

Agenda

- Compression Techniques
- Index Structures
- Table Partitioning
- Materialized Views

Compression Techniques

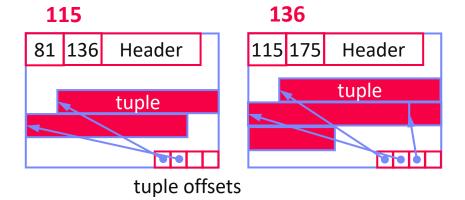

Overview Database Compression

Background: Storage System

- Buffer and storage management (incl. I/O) at granularity of pages
- PostgreSQL default: 8KB
- Different table/page layouts (e.g., NSM, DSM, PAX, column)

Compression Overview

- Fit larger datasets in memory, less I/O, better cache utilization
- Some allow query processing directly on the compressed data
- #1 Page-level compression (general-purpose GZIP, Snappy, LZ4)
- #2 Row-level heavyweight/lightweight compression
- #3 Column-level lightweight compression
- #4 Specialized log and index compression

[Patrick Damme et al: Lightweight Data Compression Algorithms: An Experimental Survey. **EDBT 2017**]

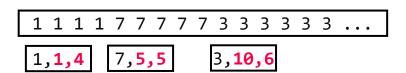

Lightweight Database Compression Schemes

Null Suppression

 Compress integers by omitting leading zero bytes/bits (e.g., NS, gamma) 106 | 00000000 | 00000000 | 00000000 | 01101010 | 11 | 01101010

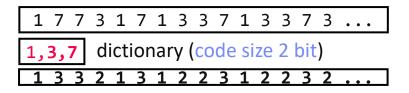

Run-Length Encoding

 Compress sequences of equal values by runs of (value, start, run length)

Dictionary Encoding

 Compress column w/ few distinct values as pos in dictionary (→ code size)

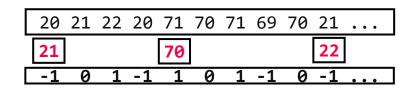

Delta Encoding

 Compress sequence w/ small changes by storing deltas to previous value

Frame-of-Reference Encoding

 Compress values by storing delta to reference value (outlier handling)

Index Structures

Overview Index Structures

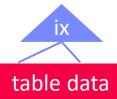

Table Scan vs Index Scan

- For highly selective predicates, index scan asymptotically much better than table scan
- Index scan higher per tuple overhead (break even ~5% output ratio)
- Multi-column predicates: fetch/RID-list intersection

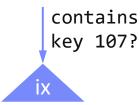

Table Scan Index Scan

Uses of Indexes

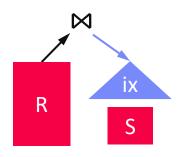

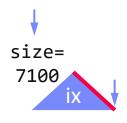

Unique Constraints

Index Nested Loop Joins

Aggregates (count, min/max)

[Theo Härder, Erhard Rahm:

Classification of Index Structures

Datenbanksysteme – Konzepte **Traditional** und Techniken der Imple-**1D Access Methods** mentierung, Springer, 2001] Classification **Key Transformation Key Comparison Tree-Based Sort-Based** Hash-Based Sequential **Sequential Lists Binary Search Trees** Static Linked Lists Multiway Trees (B-Tree) **Dynamic**

Prefix Trees for in-memory DBs

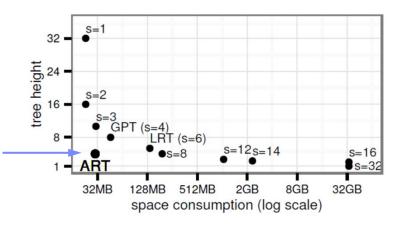

[Matthias Boehm et al: Efficient In-Memory Indexing with Generalized Prefix Trees. BTW 2011]

Prefix Trees (Tries)

[Viktor Leis, Alfons Kemper, Thomas Neumann: The adaptive radix tree: ARTful Indexing for Main-Memory Databases. **ICDE 2013**]

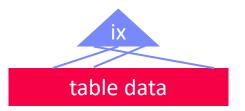

Recap: Index Creation/Deletion via SQL

Create Index

- Create a secondary (nonclustered) index on a set of attributes
- Clustered (primary): tuples sorted by index
- Non-clustered (secondary): sorted attribute with RIDs
- Can specify uniqueness, order, and indexing method
- PostgreSQL: [btree], hash, gist, and gin

Delete Index

Drop indexes by name

DROP INDEX ixStudLname;

CREATE INDEX ixStudLname

ON Students **USING** btree

(Lname ASC NULLS FIRST);

Tradeoffs

- Indexes often automatically created for primary keys / unique attributes
- Lookup/scan/join performance vs insert performance
- Analyze usage statistics: pg_stat_user_indexes, pg_stat_all_indexes

B-Tree Overview

History B-Tree

- Bayer and McCreight 1972 (multiple papers), Block-based, Balanced, Boeing
- Multiway tree (node size = page size); designed for DBMS
- Extensions: B+-Tree/B*-Tree (data only in leafs, double-linked leaf nodes)

Definition B-Tree (k, h)

All paths from root to leafs have equal length h

$$\lceil \log_{2k+1}(n+1) \rceil \le h \le \lceil \log_{k+1}\left(\frac{n+1}{2}\right) \rceil + 1$$

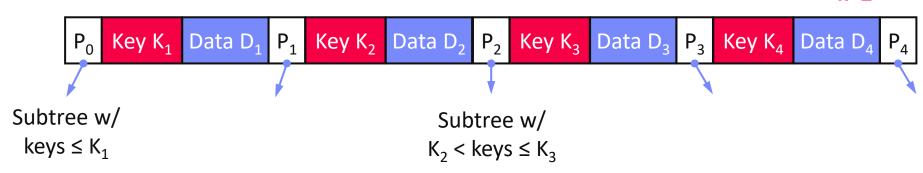

All nodes (except root) have [k, 2k] key entries

All nodes adhere to max constraints

All nodes (except root, leafs) have [k+1, 2k+1] successors

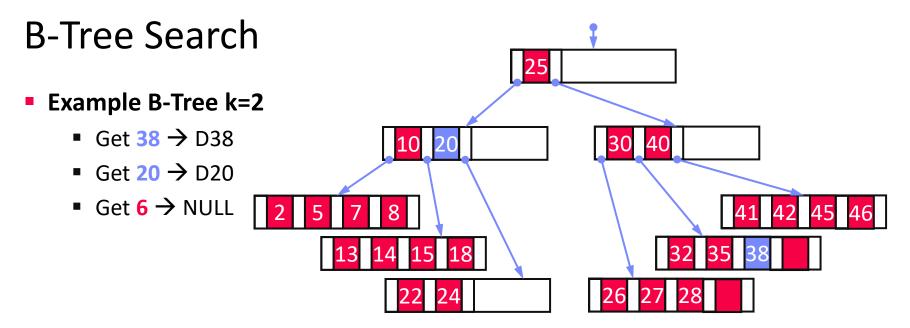

Data is a record or a reference to the record (RID)

k=2

Lookup Q_K within a node

- Scan / binary search keys for Q_K, if K_i=Q_K, return D_i
- If node does not contain key
 - If leaf node, abort search w/ NULL (not found), otherwise
 - Decent into subtree Pi with $K_i < Q_K \le K_{i+1}$

Range Scan Q_{L<K<U}

■ Lookup Q_L and call next K while K<Q_U (keep current position and node stack)

B-Tree Insert

Basic Insertion Approach

- Always insert into leaf nodes!
- Find position similar to lookup, insert and maintain sorted order
- If node overflows (exceeds 2k entries) → node splitting

Node Splitting Approach

Split the 2k+1 entries into two leaf nodes

Left node: first k entries

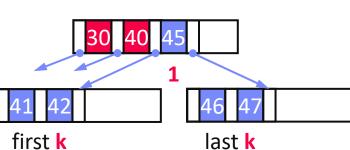

Right node: last k entries

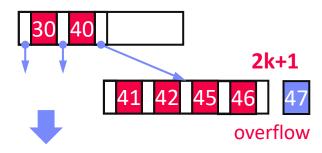

(k+1)th entry inserted into parent node

→ can cause recursive splitting

Special case: root split (h++)

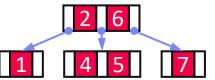

B-Tree Insert, cont. (Example w/ k=1)

1

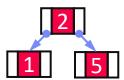

Insert 4

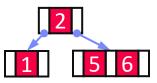

Insert 5

1 5

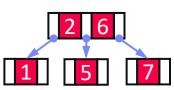

Insert 2 (split)

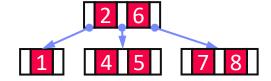

Insert 6

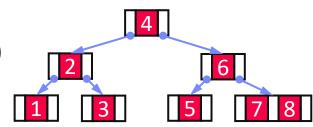

Insert 7 (split)

Insert 8

Insert 3 (2x split)

Note: Exercise 03, Task 3.2? (B-tree insertion and deletion)

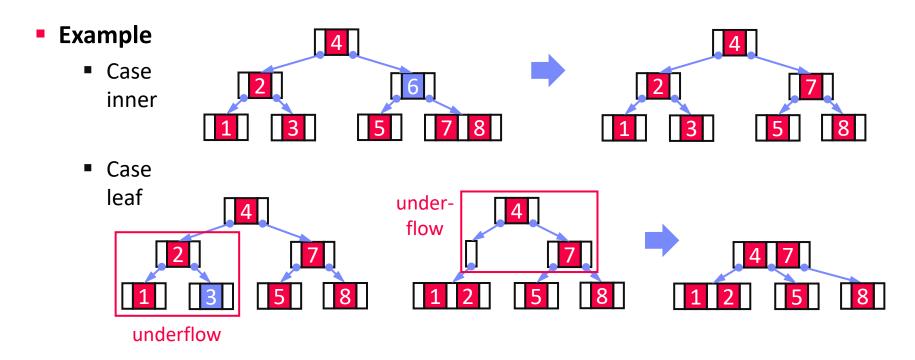

B-Tree Delete

Basic Deletion Approach

- Lookup deletion key, abort if non-existing
- Case inner node: move entry from fullest successor node into position
- Case leaf node: if underflows (<k entries) → merge w/ sibling</p>

insert (107, value4)

0000 0000 **0110 1011**

Excursus: Prefix Trees (Radix Trees, Tries)

Generalized Prefix Tree

Arbitrary data types (byte sequences)

Configurable prefix length k'

■ Node size: s = 2^{k'} references

Fixed maximum height h = k/k'

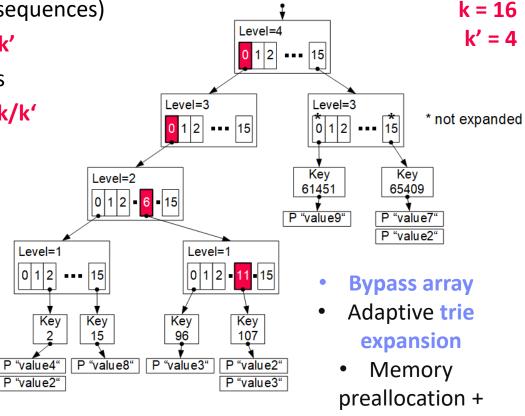

Secondary index structure

Characteristics

- Partitioned data structure
- Order-preserving (for range scans)
- Update-friendly

Properties

- Deterministic paths
- Worst-case complexity O(h)

reduced pointers

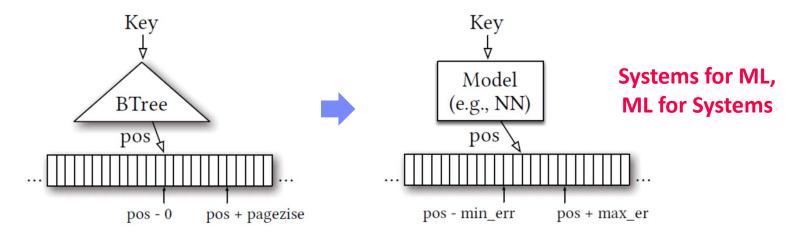

Excursus: Learned Index Structures

- A Case For Learned Index Structures
 - Sorted data array, predict position of key
 - Hierarchy of simple models (stages models)

[Tim Kraska, Alex Beutel, Ed H. Chi, Jeffrey Dean, Neoklis Polyzotis: The Case for Learned Index Structures. SIGMOD 2018]

Tries to approximate the CDF similar to interpolation search (uniform data)

Follow-up Work on SageDBMS

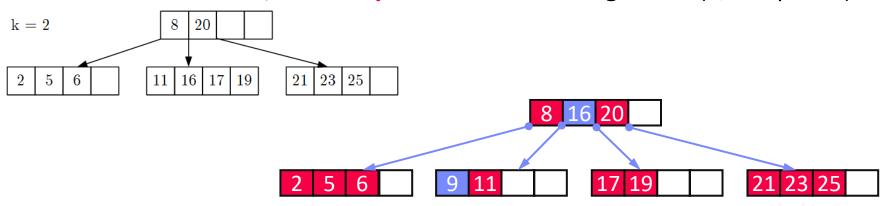

[Tim Kraska, Mohammad Alizadeh, Alex Beutel, Ed H. Chi, Ani Kristo, Guillaume Leclerc, Samuel Madden, Hongzi Mao, Vikram Nathan: SageDB: A Learned Database System. CIDR 2019]

BREAK (and Test Yourself)

■ Given B-tree below, insert key 9 and draw resulting B-tree (7/100 points)

■ Given B-tree below, delete key 27, and draw resulting B-tree (8/100 points)

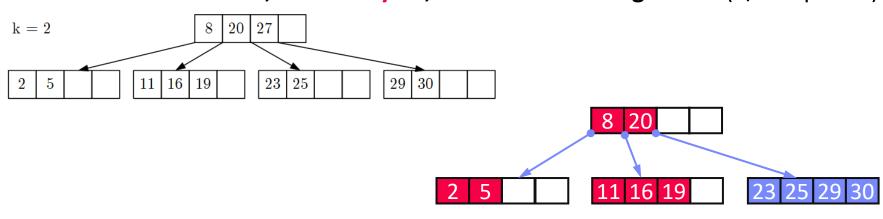

Table Partitioning

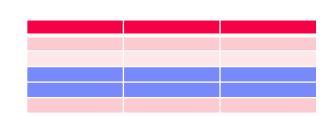

Overview Partitioning Strategies

- Horizontal Partitioning
 - Relation partitioning into disjoint subsets
- Vertical Partitioning
 - Partitioning of attributes with similar access pattern
- Hybrid Partitioning
 - Combination of horizontal and vertical fragmentation (hierarchical partitioning)
- Derived Horizontal Partitioning

Correctness Properties

#1 Completeness

- $R \rightarrow R_1, R_2, ..., R_n$ (Relation R is partitioned into *n* fragments)
- Each item from R must be included in at least one fragment

#2 Reconstruction

- $R \rightarrow R_1, R_2, ..., R_n$ (Relation R is partitioned into *n* fragments)
- Exact reconstruction of fragments must be possible

#3 Disjointness

- $R \rightarrow R_1, R_2, ..., R_n$ (Relation R is partitioned into n fragments)
- $R_i \cap R_j = \emptyset \ (1 \le i, j \le n; \ i \ne j)$

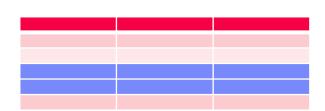

Horizontal Partitioning

Row Partitioning into n Fragments R_i

- Complete, disjoint, reconstructable
- Schema of fragments is equivalent to schema of base relation

Partitioning

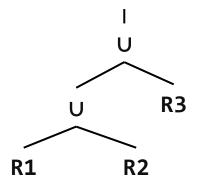

- Split table by n selection predicates P_i
 (partitioning predicate) on attributes of R
- Beware of attribute domain and skew

$$R_i = \sigma_{P_i}(R)$$

$$(1 \le i \le n)$$

Reconstruction

- Union of all fragments
- Bag semantics, but no duplicates across partitions

$$R = \bigcup_{1 \le i \le n} R_i$$

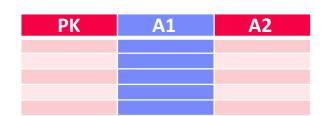

A1

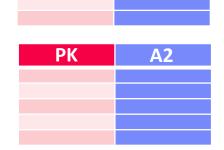

Vertical Fragmentation

- Column Partitioning into n Fragments Ri
 - Complete, reconstructable, but not disjoint (primary key for reconstruction via join)
 - Completeness: each attribute must be included in at least one fragment

- Partitioning
 - Partitioning via projection
 - Redundancy of primary key

R_i	=	$\pi_{PK,A_i}($	R)
		$i \leq n$	

- Reconstruction
 - Natural join over primary key $(1 \le i \le n)$

$$R = R_1 \bowtie R_i \bowtie R_n$$
$$(1 \le i \le n)$$

Hybrid horizontal/vertical partitioning

$$R = R_1 \bowtie R_i \bowtie R_n \bowtie / R_i = \cup R_{ij}$$

$$\Rightarrow R = \cup R_i \bowtie / R_i = R_{1i} \bowtie R_{ij} \bowtie R_{ni}$$

Derived Horizontal Fragmentation

- Row Partitioning R into n fragements
 R_i, with partitioning predicate on S
- Austria
- Potentially complete (not guaranteed), restructable, disjoint
- Foreign key / primary key relationship determines correctness

Partitioning

- Selection on independent relation S
- Semi-join with dependent relation R to select partition R_i

$$R_{i} = R \ltimes S_{i} = R \ltimes \sigma_{P_{i}}(S)$$
$$= \pi_{R,*} \left(R \bowtie \sigma_{P_{i}}(S) \right)$$

Reconstruction

- Equivalent to horizontal partitioning
- Union of all fragments

$$R = \bigcup_{1 \le i \le n} R_i$$

Exploiting Table Partitioning

Partitioning and query rewriting

- #1 Manual partitioning and rewriting
- #2 Automatic rewriting (spec. partitioning)
- #3 Automatic partitioning and rewriting

Example PostgreSQL (#2)

```
CREATE TABLE Squad(
    JNum INT PRIMARY KEY,
    Pos CHAR(2) NOT NULL,
    Name VARCHAR(256)
) PARTITION BY RANGE(JNum);

CREATE TABLE Squad10 PARTITION OF Squad
    FOR VALUES FROM (1) TO (10);

CREATE TABLE Squad20 PARTITION OF Squad
    FOR VALUES FROM (10) TO (20);

CREATE TABLE Squad24 PARTITION OF Squad
    FOR VALUES FROM (20) TO (24);
```

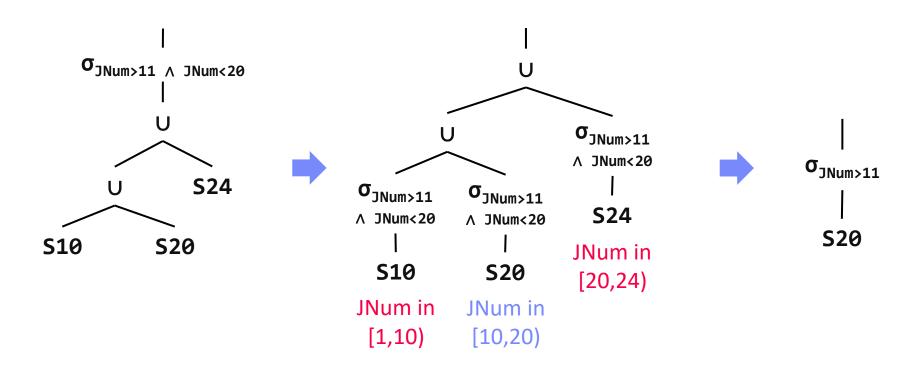

J#	Pos	Name
1	GK	Manuel Neuer
12	GK	Ron-Robert Zieler
22	GK	Roman Weidenfeller
2	DF	Kevin Großkreutz
4	DF	Benedikt Höwedes
5	DF	Mats Hummels
15	DF	Erik Durm
16	DF	Philipp Lahm
17	DF	Per Mertesacker
20	DF	Jérôme Boateng
3	MF	Matthias Ginter
6	MF	Sami Khedira
7	MF	Bastian Schweinsteiger
8	MF	Mesut Özil
9	MF	André Schürrle
13	MF	Thomas Müller
14	MF	Julian Draxler
18	MF	Toni Kroos
19	MF	Mario Götze
21	MF	Marco Reus
23	MF	Christoph Kramer
10	FW	Lukas Podolski
11	FW	Miroslav Klose

Exploiting Table Partitioning, cont.

Example, cont.

SELECT * FROM Squad
WHERE JNum > 11 AND JNum < 20

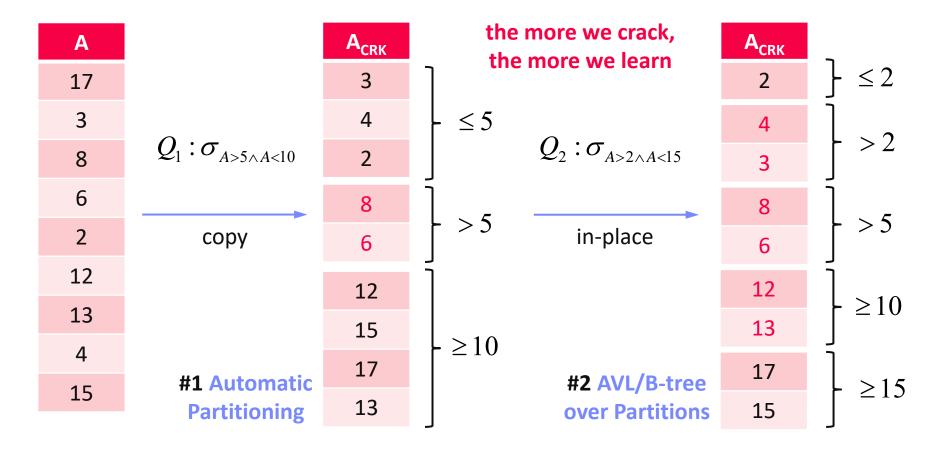

Excursus: Database Cracking

 Core Idea: Queries trigger physical reorganization (partitioning and indexing) [Pedro Holanda et al: Progressive Indexes: Indexing for Interactive Data Analysis. **PVLDB 2019**]

[Stratos Idreos, Martin L. Kersten, Stefan Manegold: Database Cracking. CIDR 2007]

Materialized Views

Overview Materialized Views

- Core Idea of Materialized Views
 - Identification of frequently re-occuring queries (views)
 - Precompute subquery results once, store and reuse many times
- The MatView Lifecycle

#1 View Selection (automatic selection via advisor tools, approximate algorithms) Materialized Views

#3 View Maintenance

(maintenance time and strategy, when and how)

#2 View Usage

(transparent query rewrite for full/partial matches)

View Selection and Usage

Motivation

- Shared subexpressions very common in analytical workloads
- Ex. Microsoft's Analytics Clusters

#1 View Selection

- Exact view selection (query containment) is NP-hard
- Heuristics, greedy and approximate algorithms

200K

160K 120K 80K 40K

1250 1000

Subexpr.

[Alekh Jindal, Konstantinos Karanasos, Sriram Rao, Hiren Patel: Selecting Subexpressions to Materialize at Datacenter Scale. **PVLDB 2018**]

cluster1 cluster2 cluster3 cluster4 cluster5

cluster1 cluster2 cluster3 cluster4 cluster5

cluster1 cluster2 cluster3 cluster4 cluster5

[Leonardo Weiss Ferreira Chaves, Erik Buchmann, Fabian Hueske, Klemens Boehm: Towards materialized view selection for distributed databases. **EDBT 2009**]

#2 View Usage

- Given query and set of materialized view, decide which views to use and rewrite the query for produce correct results
- Generation of compensation plans

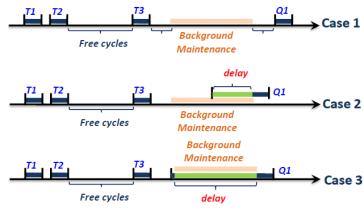

View Maintenance – When?

- Materialized view creates redundancy → Need for #3 View Maintenance
- Eager Maintenance (writer pays)
 - Immediate refresh: updates are directly handled (consistent view)
 - On Commit refresh: updates are forwarded at end of successful TXs
- Deferred Maintenance (reader pays)
 - Maintenance on explicit user request
 - Potentially inconsistent base tables and views
- Lazy Maintenance (async/reader pays)
 - Same guarantees as eager maintenance
 - Defer maintenance until free cycles or view required (invisible for updates and queries)

[Jingren Zhou, Per-Åke Larson, Hicham G. Elmongui: Lazy Maintenance of Materialized Views. **VLDB 2007**]

View Maintenance – How?

Incremental Maintenance

Propagate: Compute required updates

Apply: apply collected updates to the view

Example View:
SELECT A, SUM(B)
FROM Sales
GROUP BY CUBE(A)

Α	SUM
NULL	107
Χ	30
Υ	77

107

30

NULL

Global Net Delta Local View Delta [Global View Delta] Super Delta Apply Delta ΔR ΔV_L ΔV_G ΔV_S ΔV_A

Α	В
+ X	3
+ Z	9

Α	SUM
+ NULL	3
+ X	3
+ NULL	9
+ Z	9

Α	SUM	Α	SUN
+ NULL	12	NULL	12
+ X	3	X	3
+ Z	9	Z	9

Α	SUM
Update NULL	119
Update X	33
Insert Z	9

Incremental Propagate

Incremental Apply

Materialized Views in PostgreSQL

View Selection

- Manual definition of materialized view only
- With or without data

View Usage

- Manual use of view
- No automatic query rewriting

View Maintenance

- Manual (deferred) refresh
- Complete, no incremental maintenance
- Note: Community work on IVM

[Yugo Nagata: Implementing Incremental View Maintenance on PostgreSQL, **PGConf 2018**]

CREATE MATERIALIZED VIEW TopScorer AS

```
SELECT P.Name, Count(*)
   FROM Players P, Goals G
   WHERE P.Pid=G.Pid AND G.GOwn=FALSE
   GROUP BY P.Name
   ORDER BY Count(*) DESC
WITH DATA;
```

REFRESH MATERIALIZED VIEW TopScorer;

Name	Count
James Rodríguez	6
Thomas Müller	5
Robin van Persie	4
Neymar	4
Lionel Messi	4
Arjen Robben	3

Conclusions and Q&A

Summary

- Physical Access Paths: Compression and Index Structures
- Logical Access Paths: Table Partitioning and Materialized Views

Exercise 2 Reminder

- Submission deadline: Nov 26 11.59pm
- Start early (most time consuming of all four exercises)

Next Lectures

- Nov 18: 08 Query Processing (today → after 10min break)
- Dec 02: 09 Transaction Processing and Concurrency
