Data Integration and Analysis
10 Distributed Data Storage

Matthias Boehm

Graz University of Technology, Austria
Computer Science and Biomedical Engineering
Institute of Interactive Systems and Data Science
BMVIT endowed chair for Data Management

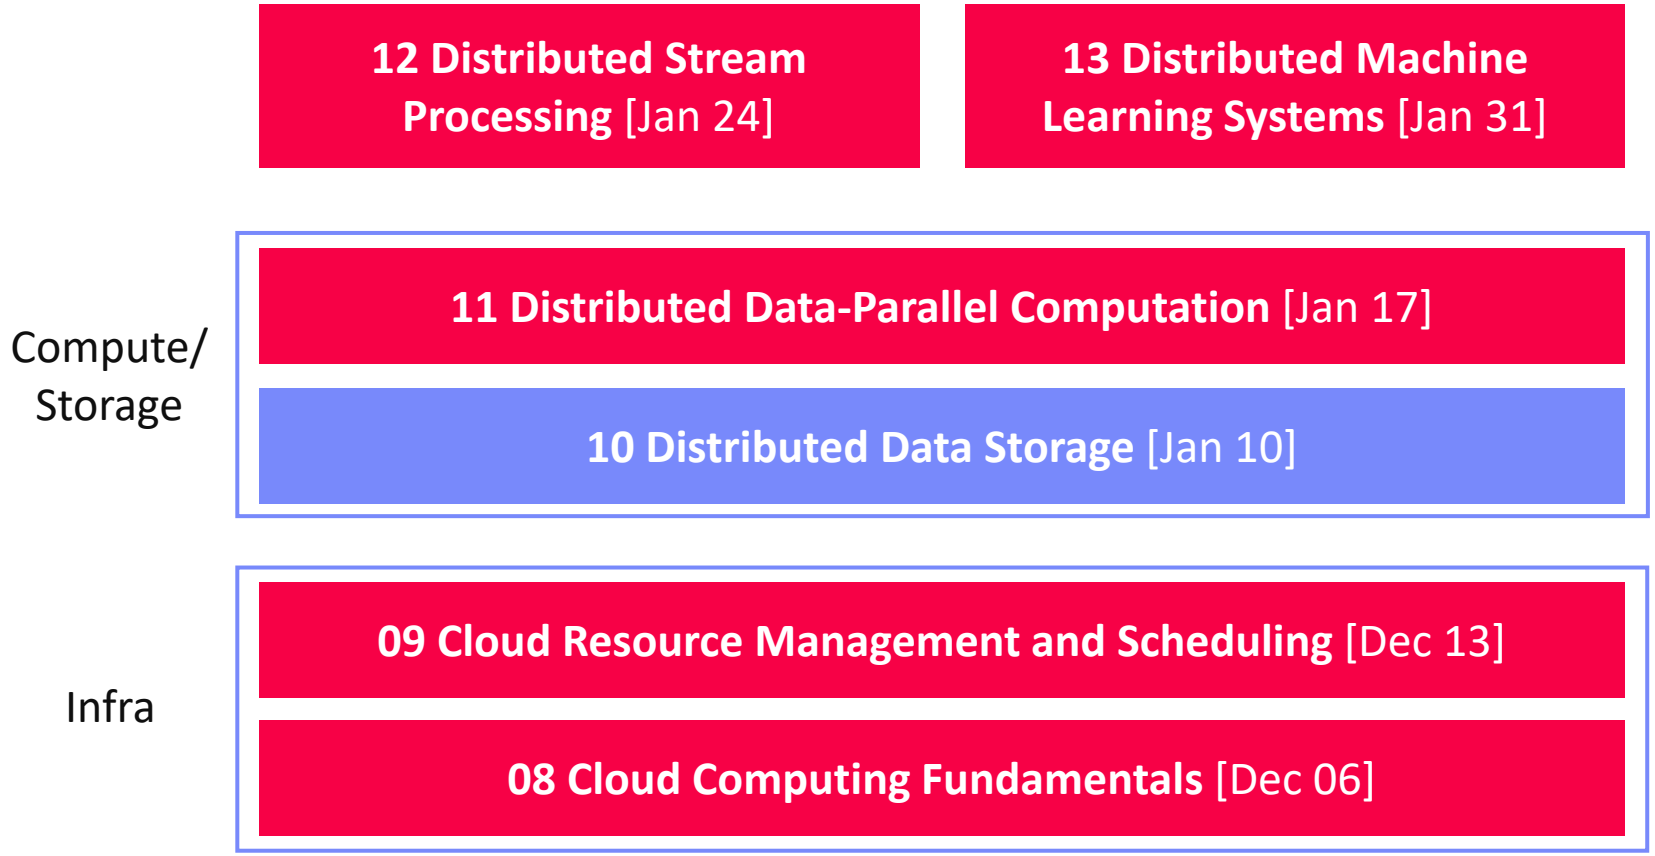
Last update: Jan 10, 2019

ISDS

Announcements/Org

- **#1 Video Recording**
  - Link in **TeachCenter** & **TUbe** (lectures will be public)
- **#2 DIA Projects**
  - **13 Projects** selected (various topics)
  - **4 Exercises** selected (distributed data deduplication)
  - **Few discussions pending** (→ m.boehm@tugraz.at)
  - SystemDS: apps into `./scripts/staging/<your_project>`
- **#3 Exam**
  - **Feb 3, 1pm – Feb 5, 2pm**, remote exam possible
  - Oral exam, **45min slots**, first-come, first-serve
  - https://doodle.com/poll/ikzsffek2vhd85q4
- **#4 Course Evaluation**
  - Evaluation time frame: **Jan 14 – Feb 14** → feedback

Course Outline Part B:
Large-Scale Data Management and Analysis

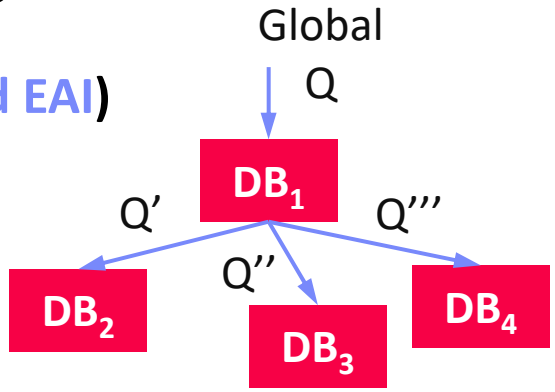


Agenda

- **Motivation and Terminology**
- **Object Stores and Distributed File Systems**
- **Key-Value Stores and Cloud DBMS**

Motivation and Terminology

Overview Distributed Data Storage



- **Recap: Distributed DBS (03 Replication, MoM, and EAI)**
  - **Distributed DB:** Virtual (logical) DB, appears like a local DB but consists of multiple physical DBs
  - Components for global query processing
  - **Virtual DBS** (homo.) vs **federated DBS** (hetero.)

- **Cloud and Distributed Data Storage**
  - **Motivation: size** (large-scale), **semi-structured**/nested , **fault tolerance**
  - **#1 Cloud and Distributed Storage**
    - **Block storage:** files split into blocks, read/write (e.g., SAN, AWS EBS)
    - **Object storage:** objects of limited size, read/replace (e.g., AWS S3)
    - **Distributed file systems:** file system on block/object stores (NFS, HDFS)
  - **#2 Database as a Service**
    - **NoSQL stores:** Key-value stores, document stores
    - **Cloud DBMSs** (SQL, for OLTP and OLAP workloads)

Central Data Abstractions

- **#1 Files and Objects**
  - **File:** Arbitrarily large sequential data in specific file format (CSV, binary, etc)
  - **Object:** binary large object, with certain meta data

- **#2 Distributed Collections**
  - Logical multi-set (**bag**) of **key-value pairs** (**unsorted collection**)
  - Different physical representations
  - **Easy distribution** of pairs via horizontal partitioning (aka shards, partitions)
  - Can be created from single file, or directory of files (unsorted)

Key	Value
4	Delta
2	Bravo
1	Alpha
3	Charlie
5	Echo
6	Foxtrott
7	Golf

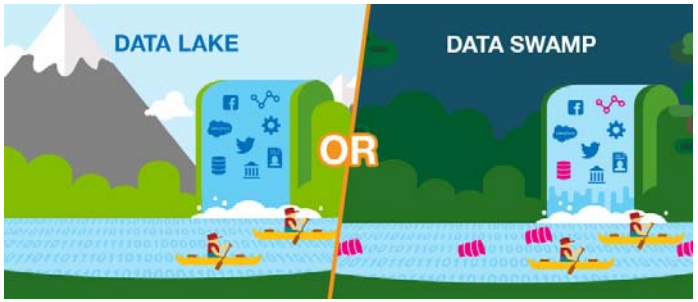
Data Lakes

- **Concept "Data Lake"**
  - **Store massive amounts of un/semi-structured, and structured data** (append only, no update in place)
  - **No need for architected schema** or upfront costs (unknown analysis)
  - Typically: file storage in open, raw formats (inputs and intermediates)

  ➔ **Distributed storage and analytics** for scalability and agility

- **Criticism: Data Swamp**
  - Low data quality (lack of schema, integrity constraints, validation)
  - Missing meta data (context) and data catalog for search

  ➔ **Requires proper data curation / tools**
  According to priorities (data governance)



[**Credit:** www.collibra.com]

Catalogs of Data and Artefacts

Recap FAIR Data Principles (see **07 Data Provenance**)

- **Data Catalogs**
  - Data curation in repositories for finding relevant datasets in data lakes
  - Augment data with open and linked data sources

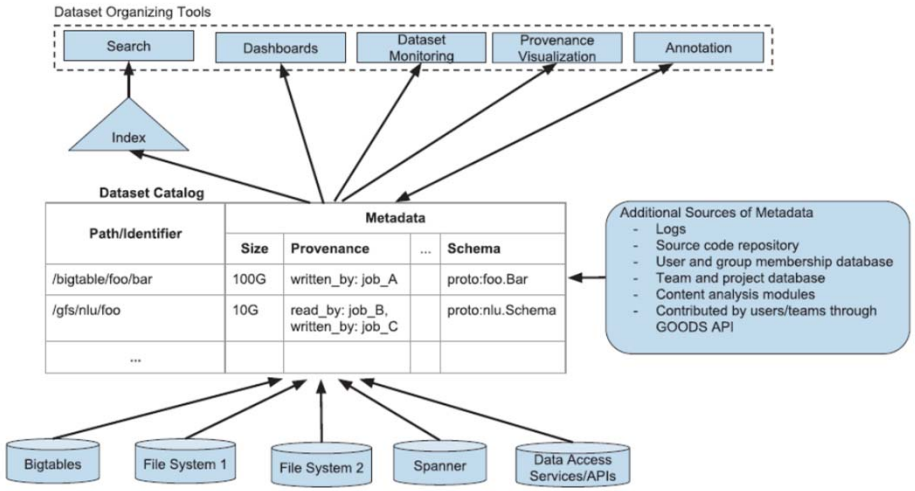
- **Examples**

[Alon Y. Halevy et al: Goods: Organizing Google's Datasets. **SIGMOD 2016**]

SAP Data Hub

[SAP Sapphire Now 2019]

Google Data Search



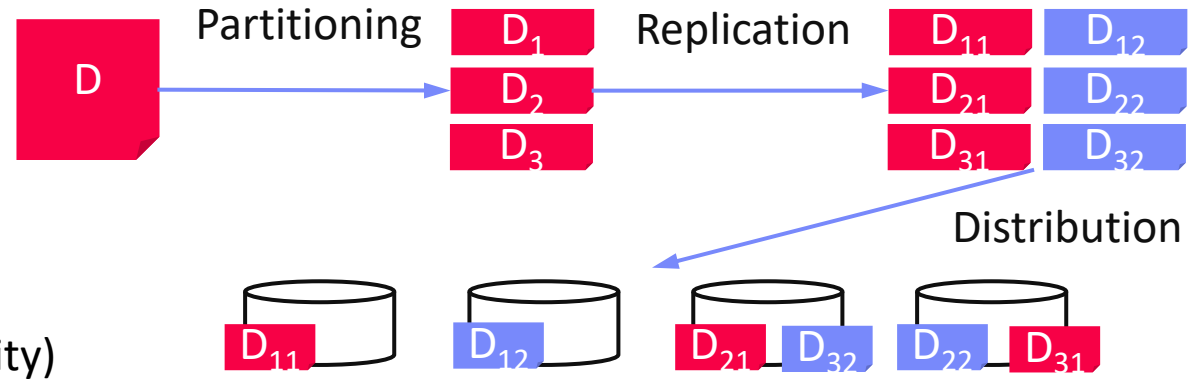
Object Stores and Distributed File Systems

Object Storage

- **Recap: Key-Value Stores**
  - **Key**-**value** mapping, where values can be of a variety of data types
  - APIs for CRUD operations; scalability via sharding (**objects** or object segments)

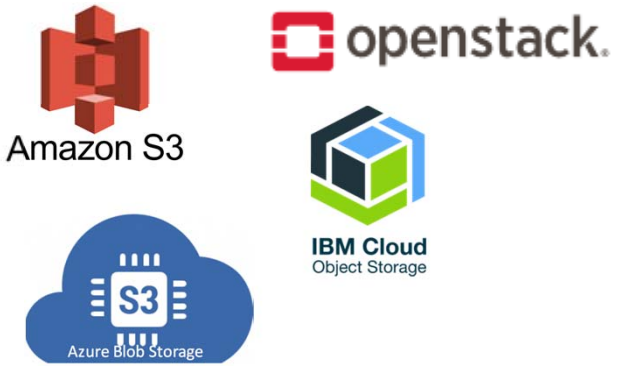
- **Object Store**
  - Similar to key-value stores, but: **optimized for large objects in GBs and TBs**
  - Object identifier (**key**), **meta data**, and object as binary large object (**BLOB**)
  - APIs: often REST APIs, SDKs, sometimes implementation of DFS APIs

- **Key Techniques**
  - Partitioning
  - Replication & Distribution
  - Erasure Coding (partitioning + parity)



Object Storage, cont.

- **Example Object Stores / Protocols**
  - Amazon Simple Storage Service (S3)
  - OpenStack Object Storage (Swift)
  - IBM Object Storage
  - Microsoft Azure Blob Storage



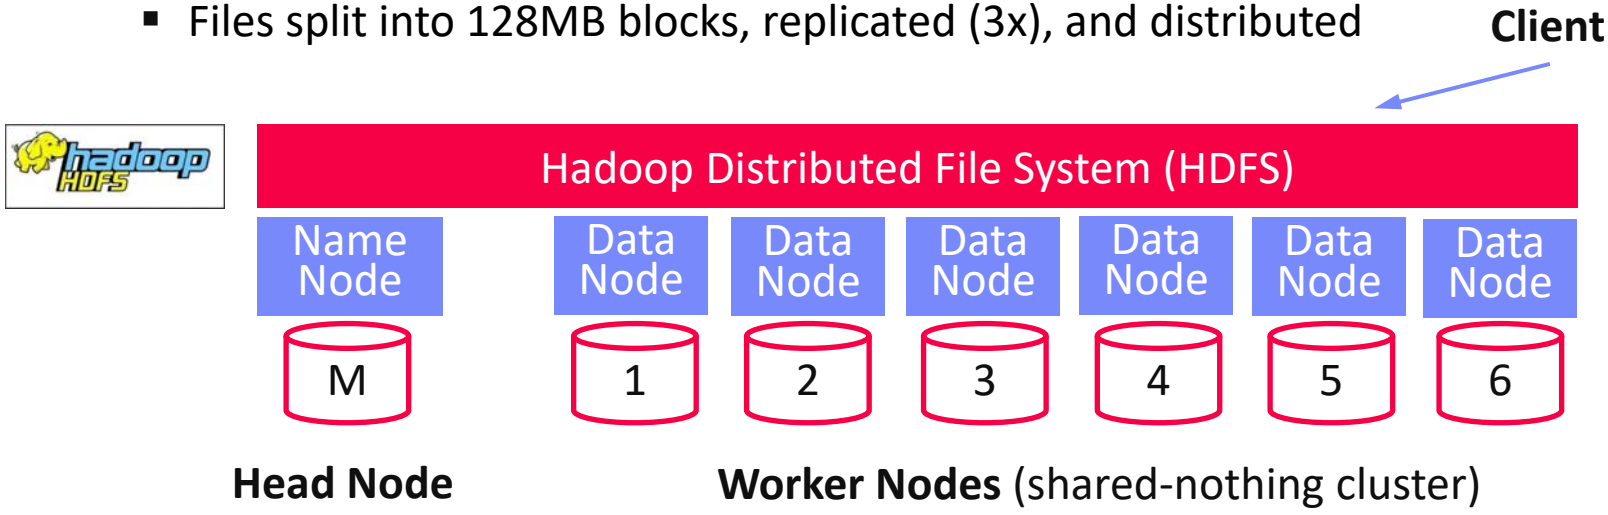
- **Amazon S3**
  - Reliable object store for photos, videos, documents or any binary data
  - **Bucket:** Uniquely named, static data container
    `http://s3.aws-eu-central-1.amazonaws.com/mboehm7datab`
  - **Object:** key, version ID, value, metadata, access control
  - Single (5GB)/multi-part (5TB) upload and direct/BitTorrent download
  - **Storage classes:** STANDARD, STANDARD_IA, GLACIER, DEEP_ARCHIVE
  - **Operations:** GET/PUT/LIST/DEL, and SQL over CSV/JSON objects

Hadoop Distributed File System (HDFS)

- **Brief Hadoop History**
  - Google's GFS + MapReduce [ODSI'04]
    → Apache Hadoop (2006)
  - Apache Hive (SQL), Pig (ETL), Mahout/SystemML (ML), Giraph (Graph)

[Sanjay Ghemawat, Howard Gobioff, Shun-Tak Leung: The Google file system. **SOSP 2003**]

- **HDFS Overview**
  - Hadoop's distributed file system, for large clusters and datasets
  - Implemented in Java, w/ native libraries for compression, I/O, CRC32
  - Files split into 128MB blocks, replicated (3x), and distributed



HDFS Daemon Processes

- **HDFS NameNode**
  - Master daemon that manages file system namespace and access by clients
  - Metadata for all files (e.g., replication, permissions, sizes, block ids, etc)
  - **FSImage:** checkpoint of FS namespace
  - **EditLog:** **write-ahead-log (WAL)** of file write operations (merged on startup)

```
hadoop fs -ls ./data/mnist1m.bin
```

```
-rw-r--r--   3 mboehm hdfs  137887319 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00001
-rw-r--r--   3 mboehm hdfs  139012247 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00002
-rw-r--r--   3 mboehm hdfs  139123247 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00003
-rw-r--r--   3 mboehm hdfs  139053743 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00004
-rw-r--r--   3 mboehm hdfs  138928955 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00005
-rw-r--r--   3 mboehm hdfs  139016375 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00006
-rw-r--r--   3 mboehm hdfs  139047923 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00007
-rw-r--r--   3 mboehm hdfs  139042307 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00008
-rw-r--r--   3 mboehm hdfs  139068143 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00009

-rw-r--r--   3 mboehm hdfs  139030751 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00013
-rw-r--r--   3 mboehm hdfs  139172051 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00014
-rw-r--r--   3 mboehm hdfs  138962735 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00015
-rw-r--r--   3 mboehm hdfs  139079495 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00016
-rw-r--r--   3 mboehm hdfs   63417008 2018-10-20 22:59 /user/mboehm/data/mnist1m.bin/0-m-00017
```

- **HDFS DataNode**
  - Worker daemon per cluster node that manages block storage (list of disks)
  - Block creation, deletion, replication as individual files in local FS
  - On startup: scan local blocks and send **block report** to name node
  - Serving block read and write requests
  - Send heartbeats to NameNode (capacity, current transfers) and receives replies (replication, removal of block replicas)

HDFS InputFormats and RecordReaders

- **Overview InputFormats**
  - **InputFormat:** implements access to distributed collections in files
  - **Split:** record-aligned block of file (aligned with HDFS block size)
  - **RecordReader:** API for reading key-value pairs from file splits
  - Examples: FileInputFormat, TextInputFormat, SequenceFileInputFormat

- **Example Text Read**

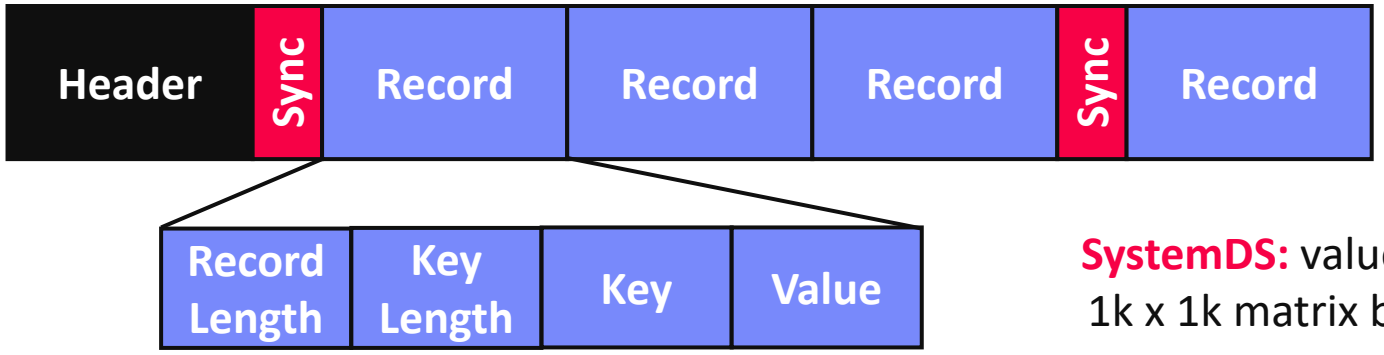
```
FileInputFormat.addInputPath(job, path); # path: dir/file
TextInputFormat informat = new TextInputFormat();
InputSplit[] splits = informat.getSplits(job, numSplits);

LongWritable key = new LongWritable();
Text value = new Text();
for(InputSplit split : splits) {
  RecordReader<LongWritable,Text> reader = informat
    .getRecordReader(split, job, Reporter.NULL);
  while( reader.next(key, value) )
    ... //process individual text lines
}
```

HDFS InputFormats and RecordReaders, cont.

- **Sequence Files**
  - **Binary files for key/value pairs**, w/ optional compression (MapReduce/Spark inputs/outputs, MapReduce intermediates)
  - InputFormat with readers, writers, and sorters

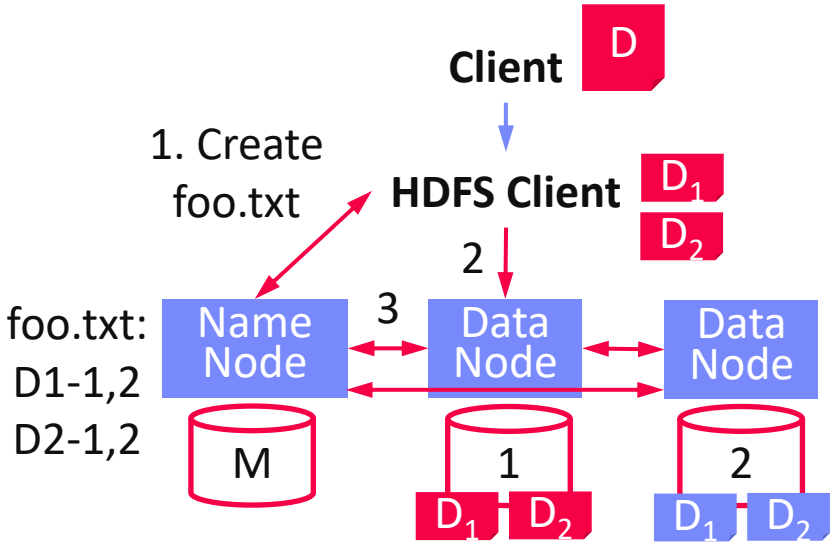
- **Example Uncompressed SequenceFile**
  - **Header:** SEQ+version (4 bytes), keyClassName, valueClassName, compression, blockCompression, compressor class (codec), meta data
  - Splittable binary representation of key-value pair collection



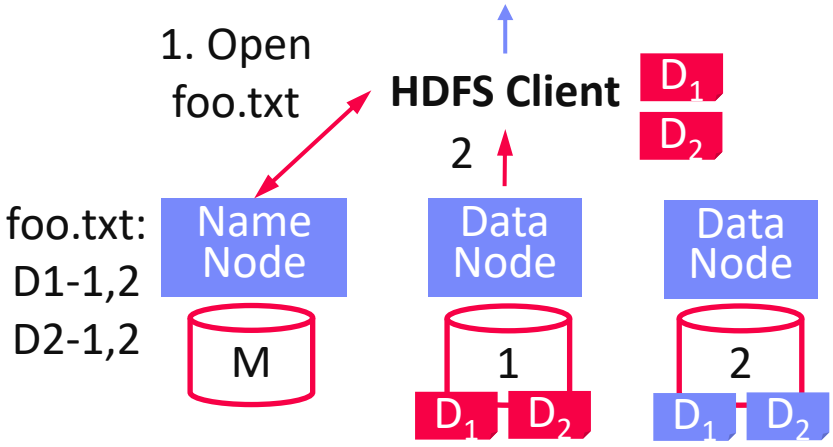
SystemDS: values are 1k x 1k matrix blocks

HDFS Write and Read

- **HDFS Write**
  - #1 Client RPC to NameNode to create file → lease/replica DNs
  - #2 Write blocks to DNs, pipelined replication to other DNs
  - #3 DNs report to NN via heartbeat



- **HDFS Read**
  - #1 Client RPC to NameNode to open file → DNs for blocks
  - #2 Read blocks sequentially from closest DN w/ block
  - InputFormats and RecordReaders as abstraction for multi-part files (incl. compression/encryption)



HDFS Data Locality

- **Data Locality**
  - **HDFS is generally rack-aware** (node-local, rack-local, other)
  - Schedule reads from closest data node
  - **Replica placement** (rep 3): local DN, other-rack DN, same-rack DN
  - MapReduce/Spark: locality-aware execution (**function vs data shipping**)

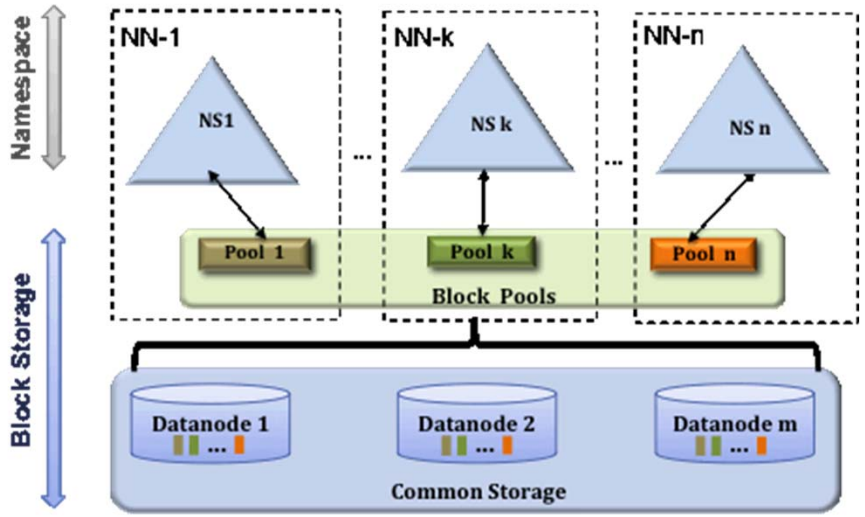
- **Custom Locality Information**
  - Custom **InputFormat** and **FileSplit** implementations
  - Return customized mapping of locations on getLocations()
  - Can use block locations of arbitrary files

```
public class MyFileSplit extends FileSplit
{
  public MyFileSplit(FileSplit x, ...) {}
  @Override
  public String[] getLocations() {
    return new String[]{"node1","node7"};
  }
}
```

```
FileStatus st = fs.getFileStatus(new Path(fname));
BlockLocation[] tmp1 = fs.getFileBlockLocations(st, 0, st.getLen());
```

HDFS Federated NameNodes

- **HDFS Federation**
  - Eliminate NameNode as namespace scalability bottleneck
  - Independent NameNodes, responsible for name spaces
  - DataNodes store blocks of all NameNodes
  - Client-side mount tables



[**Credit:** https://hadoop.apache.org/docs/current/hadoop-project-dist/hadoop-hdfs/Federation.html]

- **GFS Multiple Cells**
  - *"We also ended up doing what we call a "multi-cell" approach, which basically made it possible to put multiple GFS masters on top of a pool of chunkservers."*
    -- Sean Quinlan

[Kirk McKusick, Sean Quinlan: GFS: evolution on fast-forward. Commun. **ACM 53(3) 2010**]

Other DFS

- **HDFS FileSystem Implementations (subset)**
  - LocalFileSystem (**file**), DistributedFileSystem (**hdfs**)
  - FTPFileSystem, HttpFileSystem, ViewFilesystem (ViewFs – mount table)
  - NativeS3FileSystem (**s3**, **s3a**), NativeSwiftFileSystem, NativeAzureFileSystem
  - Other proprietary: IBM **GPFS**, Databricks FS (DBFS)
- **Google Colossus**
  - More fine-grained accesses, Google Cloud Storage

[WIRED: Google Remakes Online Empire With 'Colossus', https://www.wired.com/2012/07/google-colossus/]

- **High-Performance Computing**
  - **Scope:** Focus on high IOPs (instead of bandwidth) with block write
  - IBM **GPFS** (General Parallel File System) / Spectrum Scale
  - **BeeGFS** (Fraunhofer GFS) – focus on usability, storage/metadata servers
  - **Lustre** (Linux + Cluster) – GPL license, LNET protocol / metadata / object storage
  - RedHat **GFS2** (Global File System) – Linux cluster file system, close to local
  - **NAS** (Network Attached Storage), **SAN** (Storage Area Network)

Key-Value Stores and Cloud DBMS

Motivation and Terminology

- **Motivation**
  - **Basic key-value mapping via simple API** (more complex data models can be mapped to key-value representations)
  - **Reliability at massive scale on commodity HW** (cloud computing)

- **System Architecture**
  - **Key**-value maps, where values can be of a variety of data types
  - APIs for CRUD operations (create, read, update, delete)
  - Scalability via sharding (horizontal partitioning)

users:1:a	"Inffeldgasse 13, Graz"
users:1:b	"[12, 34, 45, 67, 89]"
users:2:a	"Mandellstraße 12, Graz"
users:2:b	"[12, 212, 3212, 43212]"

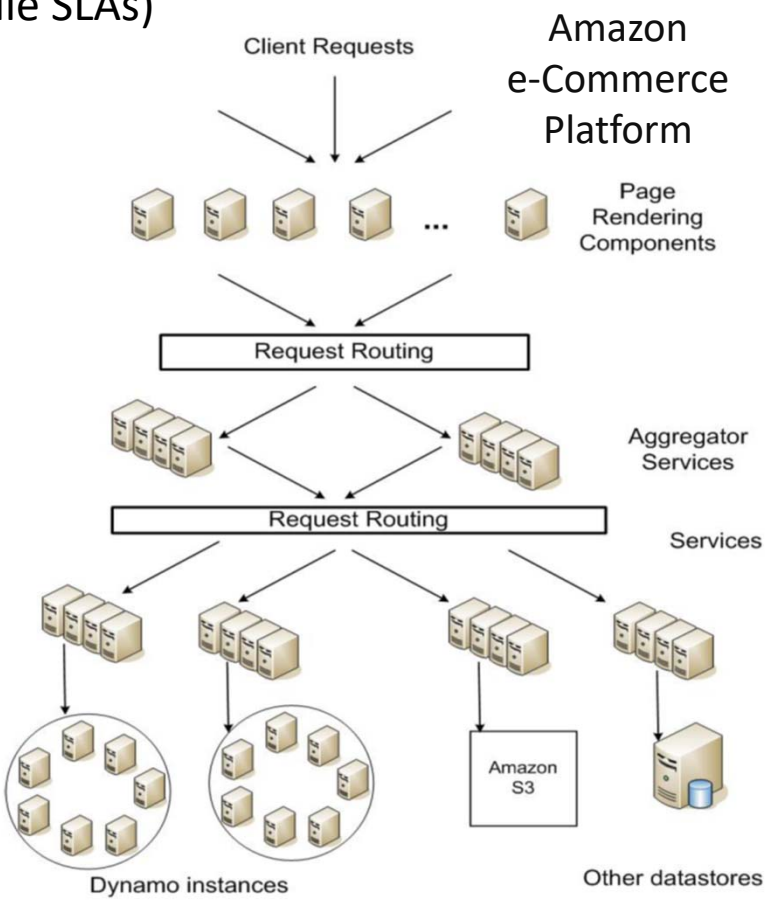
- **Example Systems**
  - **Dynamo** (2007, AP) → **Amazon DynamoDB** (2012)
  - **Redis** (2009, CP/AP)

[Giuseppe DeCandia et al: Dynamo: amazon's highly available **key-value store**. **SOSP 2007**]

Example Systems: Dynamo

[Giuseppe DeCandia et al: Dynamo: amazon's highly available **key-value store**. **SOSP 2007**]

- **Motivation**
  - **Simple**, **highly-available** data storage for small objects in ~1MB range
  - Aim for **good load balance** (99.9th percentile SLAs)
- **#1 System Interface**
  - Simple get(k, ctx) and put(k, ctx) ops
- **#2 Partitioning**
  - **Consistent hashing** of nodes and keys on circular ring for **incremental scaling**
  - Nodes hold **multiple virtual nodes** for **load balance** (add/rm, heterogeneous)
- **#3 Replication**
  - Each data item **replicated N times** (at coord node and N-1 successors)
  - Eventual consistency with async update propagation based on **vector clocks**
  - Replica synchronization via **Merkle trees**



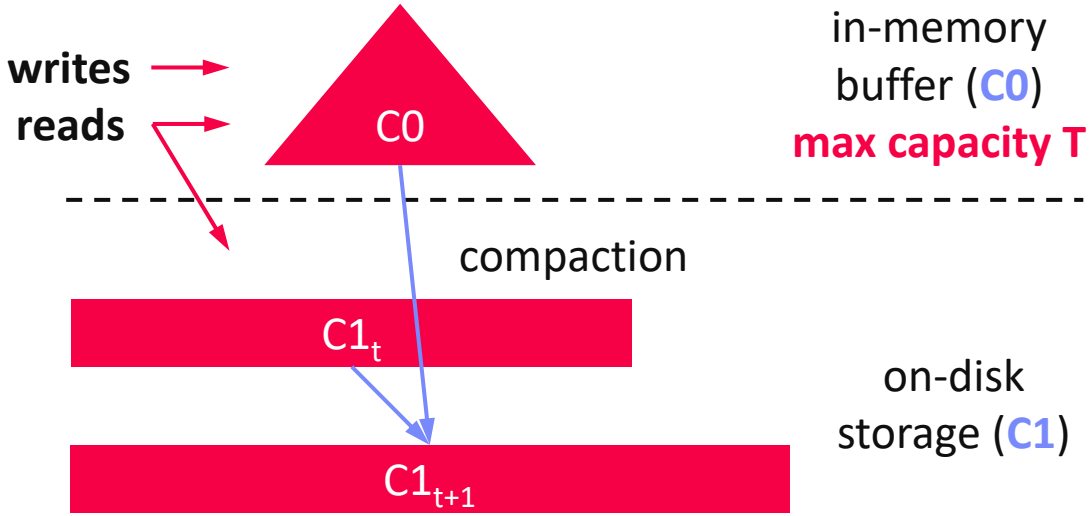
Example Systems, cont.

- **Redis Data Types**
  - Redis is not a plain KV-store, but “data structure server” with persistent log (**appendfsync no/everysec/always**)
  - **Key:** ASCII string (max 512MB, common key schemes: comment:1234:reply.to)
  - **Values:** strings, lists, sets, sorted sets, hashes (map of string-string), etc
- **Redis APIs**
  - **SET/GET/DEL:** insert a key-value pair, lookup value by key, or delete by key
  - **MSET/MGET:** insert or lookup multiple keys at once
  - **INCRBY/DECBY:** increment/decrement counters
  - Others: EXISTS, LPUSH, LPOP, LRANGE, LTRIM, LLEN, etc
- **Other systems**
  - Classic KV stores (AP): **Riak**, **Aerospike**, **Voldemort**, **LevelDB**, **RocksDB**, **FoundationDB**, **Memcached**
  - Wide-column stores: **Google BigTable** (CP), **Apache HBase** (CP), **Apache Cassandra** (AP)

Log-structured Merge Trees

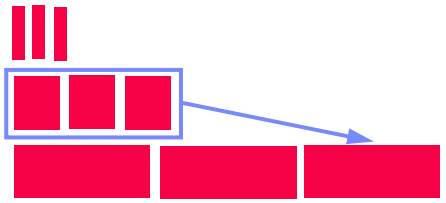
[Patrick E. O'Neil, Edward Cheng, Dieter Gawlick, Elizabeth J. O'Neil: The Log-Structured Merge-Tree (LSM-Tree). **Acta Inf. 1996**]

- **LSM Overview**
  - Many KV-stores rely on LSM-trees as their storage engine (e.g., **BigTable**, **DynamoDB**, **LevelDB**, **Riak**, **RocksDB**, **Cassandra**, **HBase**)
  - **Approach:** Buffers writes in memory, flushes data as sorted runs to storage, merges runs into larger runs of next level (compaction)
- **System Architecture**
  - Writes in C0
  - Reads against C0 and C1 (w/ buffer for C1)
  - Compaction (rolling merge): sort, merge, including **deduplication**

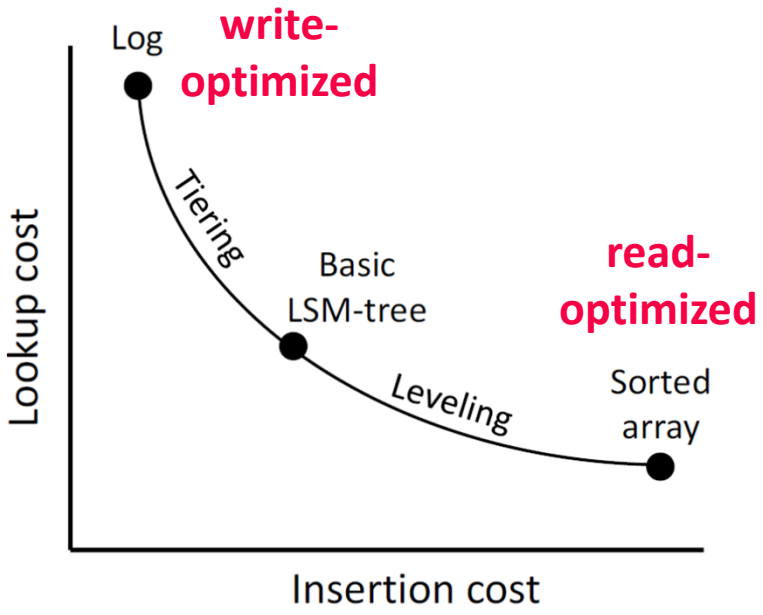


Log-structured Merge Trees, cont.

- **LSM Tiering**
  - Keep up to T-1 runs per level L
  - Merge all runs of L_i into 1 run of L_{i+1}
    - L1
    - L2
    - L3



- **LSM Leveling**
  - Keep 1 run per level L
  - Merge run of Li with Li+1
    - L1
    - L2
    - L3



[Niv Dayan: Log-Structured-Merge Trees, **Comp115 guest lecture, 2017**]

Cloud Databases (DBaaS)

- **Motivation DBaaS**
  - Simplified setup, maintenance, tuning and auto scaling
  - Multi-tenant systems (scalability, learning opportunities)
  - Different types based on workload (OLTP vs OLAP)

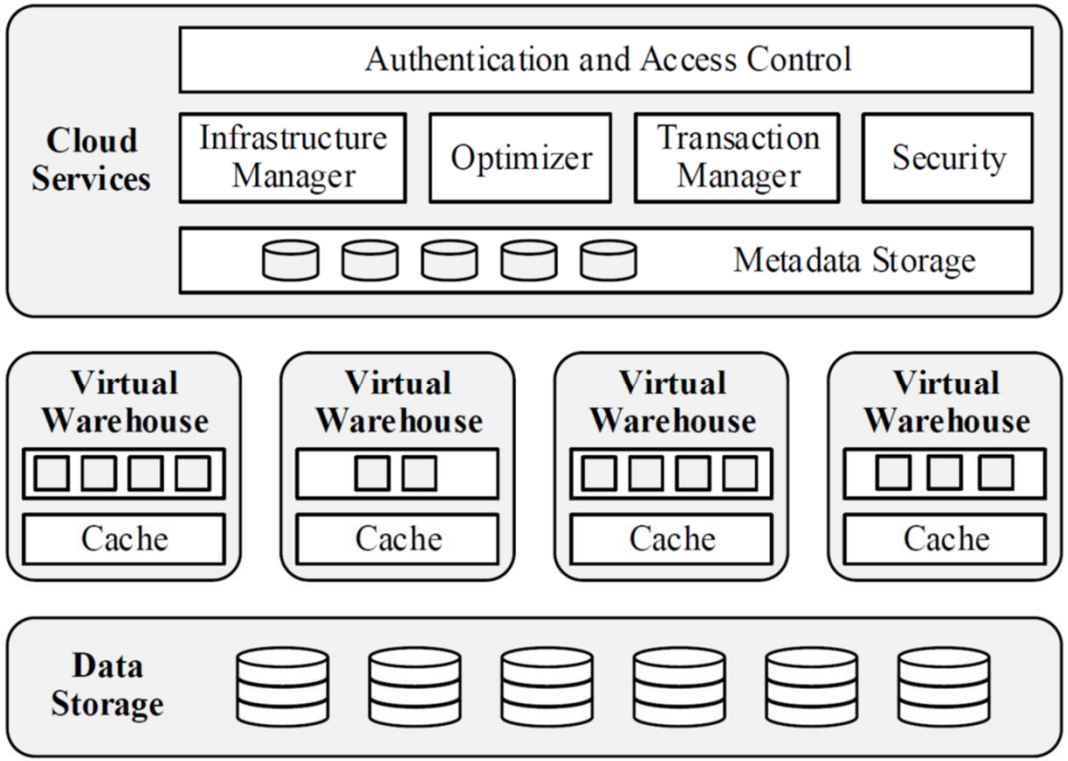
- **Elastic Data Warehouses**
  - Motivation: Intersection of data warehousing (**02 DWH, ETL, SQL/OLAP**), cloud computing (**08/09 Cloud Computing**), Distributed Storage (**10 today**)
  - Example Systems
    - **#1** Snowflake
    - **#2** Google BigQuery (Dremel)
    - **#3** Amazon Redshift
    - Azure SQL Data Warehouse

Commonalities:
SQL, **column stores**,
data on **object store / DFS**,
elastic cloud scaling

Example Snowflake

[Benoît Dageville et al.: The Snowflake Elastic Data Warehouse. **SIGMOD 2016**]

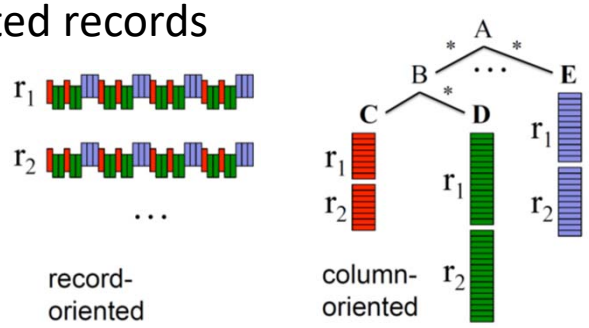
- **Motivation** (impl started late 2012)
  - **Enterprise-ready DWH solution for the cloud** (elasticity, semi-structured)
  - Pure SaaS experience, high availability, cost efficient
- **Cloud Services**
  - Manage virtual DHWs, TXs, and queries
  - Meta data and catalogs
- **Virtual Warehouses**
  - Query execution in EC2
  - Caching/intermediates
- **Data Storage**
  - **Storage in AWS S3**
  - PAX / hybrid **columnar**
  - **Min-max pruning**



Example Google BigQuery

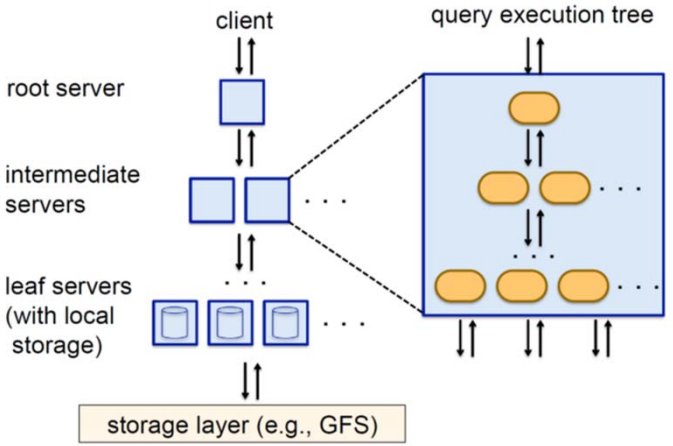
[Sergey Melnik et al.: Dremel: Interactive Analysis of Web-Scale Datasets. **PVLDB 3(1) 2010**]

- **Background Dremel**
  - Scalable and fast **in-situ analysis of read-only nested data** (DFS, BigTable)
  - **Data model:** protocol buffers - strongly-typed nested records
  - **Storage model: columnar storage of nested data** (efficient splitting and assembly records)
  - Query execution via **multi-level serving tree**



- **BigQuery System Architecture**
  - Public impl of internal Dremel system (2012)
  - SQL over structured, nested data (OLAP, BI)
  - **Extensions:** web Uis, REST APIs and ML
  - **Data storage:** Colossus (**NextGen GFS**)

[Kazunori Sato: An Inside Look at Google BigQuery, Google BigQuery White Paper 2012.]

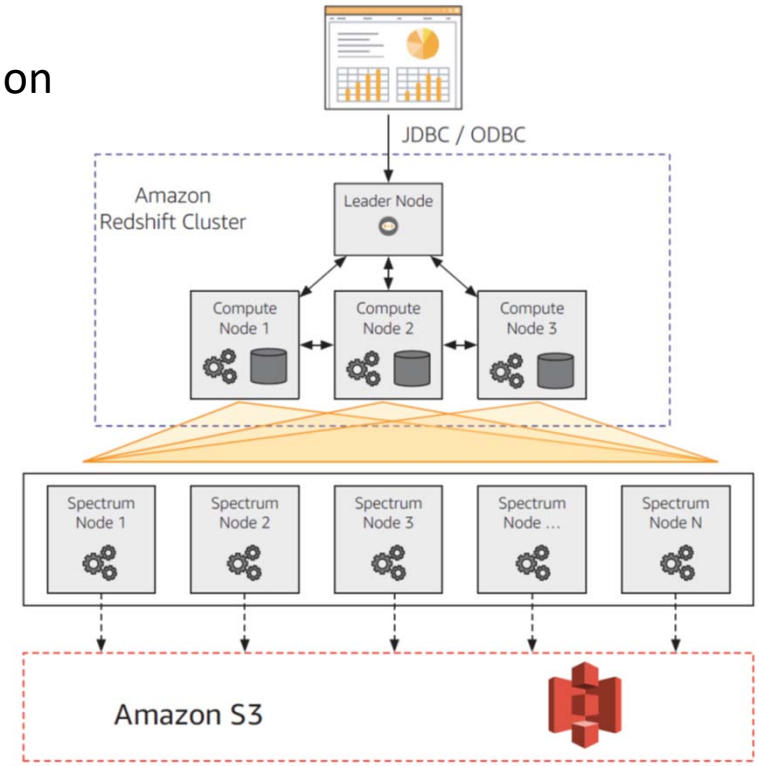


Example Amazon Redshift

[Anurag Gupta et al.: Amazon Redshift and the Case for Simpler Data Warehouses. **SIGMOD 2015**]

[Mengchu Cai et al.: Integrated Querying of SQL database data and S3 data in Amazon Redshift. **IEEE Data Eng. Bull. 41(2) 2018**]

- **Motivation** (release 02/2013)
  - **Simplicity and cost-effectiveness** (fully-managed DWH at petabyte scale)
- **System Architecture**
  - **Data plane:** data storage and SQL execution
  - **Control plane:** workflows for monitoring, and managing databases, AWS services
- **Data Plane**
  - Initial engine licensed from ParAccel
  - Leader node + sliced compute nodes in **EC2** (with **local storage**)
  - Replication across nodes + **S3 backup**
  - **Query compilation** in C++ code
  - Support for **flat and nested files**



Summary and Q&A

- **Motivation and Terminology**
- **Object Stores and Distributed File Systems**
- **Key-Value Stores and Cloud DBMS**

- **Projects and Exercises**
  - 13 projects + 4 exercises
  - **Few students w/o discussions** → setup skype call if help needed

- **Next Lectures**
  - **11 Distributed, Data-Parallel Computation** [Jan 17]
  - **12 Distributed Stream Processing** [Jan 24]
  - **13 Distributed Machine Learning Systems** [Jan 31]
