

# Data Integration and Large-scale Analysis (DIA) 07 Data Provenance and Data Catalogs

#### **Prof. Dr. Matthias Boehm**

Technische Universität Berlin Berlin Institute for the Foundations of Learning and Data Big Data Engineering (DAMS Lab)

## **Announcements / Administrative Items**

- #1 Video Recording
  - Hybrid lectures: in-person H 0107, zoom live streaming, video recording
  - https://tu-berlin.zoom.us/j/9529634787?pwd=R1ZsN1M3SC9BOU1OcFdmem9zT202UT09

#### #2 Lectures

- Dec 07: no lecture because blocked ADBS course Dec 04 Dec 07 at TU Graz
- Moved lecture 08 Cloud Fundamentals to Dec 14 and 09 Cloud Scheduling to Dec 21

#### #3 Exercises/Projects

- Reminder: exercise/project submissions by Feb 01 (no extensions)
- Make use of office hours Wed 4.30pm-6pm in TEL 0811

# zoom

## Agenda

berlin

- Motivation and Terminology
- Data Provenance
- Data Catalogs

# **Motivation and Terminology**

## **Excursus: FAIR Data Principles**

- #1 Findable
  - Metadata and data have globally unique persistent identifiers
  - Data describes w/ rich meta data; registered/indexes and searchable

#### #2 Accessible

- Metadata and data retrievable via open, free and universal commication protocols
- Metadata accessible even when data no longer available

#### #3 Interoperable

- Metadata and data use a formal, accessible, and broadly applicable format
- Metadata and data use FAIR vocabularies and qualified references

#### #4 Reusable

- Metadata and data described with plurality of accurate and relevant attributes
- Clear license, associated with provenance, meets community standards

## **Terminology of Provenance/Lineage**

**Data Provenance** 

(where?, when?,

Track and understand data origins and transformations of data

Model Measure Data Data Model Μ who?, why?, how?) **Acquire** Cleaning Training Serving Prep

- Contains meta data, context, and modifications (transform, enrichment)
- Synonyms: data provenance (arts) data lineage (royals), data pedigree (horses)
- Blockchain
  - Data structure logging transactions in verifiable and permanent way
- Data Catalogs (curation/governance)
  - Directory of datasets including data provenance (meta data, artifacts)
  - Raw/original, curated datasets, derived data products

## **Application and Goals of Provenance**

## a) High-Level Goals

- #1 Versioning and Reproducibility (analogy experiments)
- #2 Explainability, Interpretability, Verification

## b) Low-Level Goals

- #3 Full and Partial Reuse of Intermediates
- #4 Incremental Maintenance of MatViews, Models, etc
- #5 Tape/log of Executed Operations → Auto Differentiation
- #6 Recomputation for Caching / Fault Tolerance
- #7 Debugging via Lineage Query Processing

# **Data Provenance**

## **Overview Data Provenance**

- Def Data Provenance
  - Information about the origin and creation process of data
- Example
  - Debugging suspicious query results

```
SELECT Customer, sum(0.Quantity*P.Price)
FROM Orders 0, Products P
WHERE 0.PID = P.PID
GROUP BY Customer
OID Customer
```

## **Overview Data Provenance, cont.**

- An Abstract View
  - **Data:** schema, structure  $\rightarrow$  data items
  - Data composition (granularity): attribute, tuple, relation
  - Transformation: consumes inputs, produces outputs
  - Hierarchical transformations: query w/ views, query block, operators
  - Additional: env context (OS, libraries, env variables, state), users

#### Goal: Tracing of Derived Results

- Inputs and parameters
- Steps involved in creating the result
- → Store and query data & provenance
- General Data Protection Regulation (GDPR)?

Introduction to Data Provenance, Illinois Institute of Technology, 2012]

[Boris Glavic: CS595 Data Provenance –

[Zachary G. Ives: Data Provenance: Challenges, Benefits, Research, **NIH Webinar 2016**]

## **Classification of Data Provenance**

#### Overview

- Base query Q(D) = O with database D = {R<sub>1</sub>, ..., R<sub>n</sub>}
- Forward lineage query: L<sub>f</sub>(R<sub>i</sub>", O') from subset of input relation to output
- Backward lineage query: L<sub>b</sub>(O', R<sub>i</sub>) from subset of outputs to base tables

## #1 Lazy Lineage Query Evaluation

- Rewrite (invert) lineage queries as relational queries over input relations
- No runtime overhead but slow lineage query processing

## #2 Eager Lineage Query Evaluation

- Materialize annotations (data/transforms) during base query evaluation
- Runtime overhead but fast lineage query processing
- Lineage capture: Logical (relational)
  - vs physical (instrumented physical ops)

[Fotis Psallidas, Eugene Wu: Smoke: Fine-grained Lineage at Interactive Speed. **PVLDB 2018**]

## Why-Provenance

[Boris Glavic: CS595 Data Provenance – Provenance Models and Systems, Illinois Institute of Technology, 2012]

#### Overview Why

- Goal: Which input tuples contributed to an output tuple t in query Q
- Representation: Set of witnesses w for tuple t (set semantics!)
  - $w \subseteq I$  (subset of all tuples in instance I)
  - $t \in Q(w)$  (tuple in result of query over w)

#### Example Witnesses

```
SELECT Customer, Product
 FROM Orders O, Products P
 WHERE O.PID=P.PID
```

Witnesses for t1:
w1 = {o1,p2}, w2 = {o3,p2},
w3 = {o1,o3,p2},, wn = I

**Minimal witnesses** for t1:

 $w1 = \{o1, p2\}, w2 = \{o3, p2\}$ 

	Customer	Date	PID		PID	Product
<b>01</b>	А	2019-06-22	2	<b>p1</b>	1	Х
<b>o2</b>	В	2019-06-22	3	p2	2	Y
03	А	2019-06-22	2	р3	4	Z
				p4	3	W

	Customer	Product
<b>t1</b>	А	Y
t2	В	W

## **How-Provenance**

[Boris Glavic: CS595 Data Provenance – Provenance Models and Systems, Illinois Institute of Technology, 2012]

#### Overview

- Model how tuples where combined in the computation
- Alternative use: need one of the tuples (e.g., union/projection)
- Conjunctive use: need all tuples together (e.g., join)
- Provenance Polynomials
  - Semi-ring annotations to model provenance (ℕ[I], +,×, 0,1)

## How-Provenance, cont.

#### Example Exam Question:

# Given below tables R and S (with tuples r<sub>i</sub> and s<sub>i</sub>), query Q and results O, specify the provenance polynomials for every tuple in O. [3 points]

## Why Not?-Provenance

#### Overview

Why are items not in the results

#### • Example Problem:

- "Window-display-books < \$20"
- $\rightarrow$  (Euripides, Medea).
- → Why not (Hrotsvit, Basilius)?

Bug in the query / system?

#### Evaluation Strategies

- Given a user question (why no tuple satisfies predicate S), dataset D, result set R, and query Q, leverage why lineage
- **#1 Bottom-Up:** from leafs in topological order to find last op eliminating  $d \in S$

<= 20\$?

Not in

book store?

#2 Top-Down: from result top down to find last op, requires stored lineage

Author	Title	Price	Publisher
	Epic of Gilgamesh	\$150	Hesperus
Euripides	Medea	\$16	Free Press
Homer	Iliad	\$18	Penguin
Homer	Odyssey	\$49	Vintage
Hrotsvit	Basilius	\$20	Harper
Longfellow	Wreck of the Hesperus	\$89	Penguin
Shakespeare	Coriolanus	\$70	Penguin
Sophocles	Antigone	\$48	Free Press
Virgil	Aeneid	\$92	Vintage

## **Provenance for ML Pipelines (fine-grained)**

#### DEX: Dataset Versioning

- Versioning of datasets, stored with delta encoding
- Checkout, intersection, union queries over deltas
- Query optimization for finding efficient plans

#### MISTIQUE: Intermediates of ML Pipelines

- Capturing, storage, querying of intermediates
- Lossy deduplication and compression
- Adaptive querying/materialization for finding efficient plans

#### Linear Algebra Provenance

- Provenance propagation by decomposition
- Annotate parts w/ provenance polynomials (contributing inputs + impact)

[Zhepeng Yan, Val Tannen, Zachary G. Ives: Fine-grained Provenance for Linear Algebra Operators. **TaPP 2016**]

$$A = S_x B T_u + S_x C T_v + S_y D T_u + S_y E T_v$$

[Joseph M. Hellerstein et al: Ground: A Data Context Service. **CIDR 2017**]

#### [Zachary G. Ives, Yi Zhang, Soonbo Han, Nan Zheng,: Dataset Relationship Management. **CIDR 2019**]

- Programmatic API for tracking parameters, experiments, and results
- autolog() for specific params

## Flor (on Ground)

- DSL embedded in python for managing the workflow development phase of the ML lifecycle
- DAGs of actions, artifacts, and literals
- Data context generated by activities in Ground

#### Dataset Relationship Management

- Reuse, reveal, revise, retarget, reward
- Code-to-data relationships (data provenance)
- Data-to-code relationships (potential transforms)

17 Matthias Boehm | FG DAMS | DIA WiSe 2023/24 – 07 Data Provenance and Data Catalogs

## **Provenance for ML Pipelines (coarse-grained), cont.**

#### HELIX

- Goal: focus on iterative development w/ small modifications (trial & error)
- Caching, reuse, and recomputation
- Reuse as Max-Flow problem → NP-hard → heuristics
- Materialization to disk for future reuse

[Doris Xin, Stephen Macke, Litian Ma, Jialin Liu, Shuchen Song, Aditya G. Parameswaran: Helix: Holistic Optimization for Accelerating Iterative Machine Learning. **PVLDB 2018**]

# Collaborative Optimizer

[Behrouz Derakhshan, Alireza Rezaei Mahdiraji, Ziawasch Abedjan, Tilmann Rabl, Volker Markl: Optimizing Machine Learning Workloads in Collaborative Environments. **SIGMOD 2020**]

## Lineage Tracing & Reuse in SystemDS

#### Problem

- Exploratory data science (data preprocessing, model configurations)
- Reproducibility and explainability of trained models (data, parameters, prep)
- → Lineage/Provenance as Key Enabling Technique:

Model versioning, reuse of intermediates, incremental maintenance, auto differentiation, and debugging (query processing over lineage)

[Arnab Phani, Benjamin Rath, Matthias Boehm: LIMA: Fine-grained Lineage Tracing and Reuse in Machine Learning Systems, **SIGMOD 2021**]

## Efficient Lineage Tracing

- Tracing of inputs, literals, and non-determinism
- Trace lineage of logical operations
- Deduplication for loops/functions
- Program/output reconstruction

## Lineage Tracing & Reuse in SystemDS, cont.

- Multi-level, Lineage-based Reuse
  - Lineage trace uniquely identifies intermediates
  - Reuse intermediates at function / block / operation level

## Full Reuse of Intermediates

- Before executing instruction, probe output lineage in cache Map<Lineage, MatrixBlock>
- Cost-based/heuristic caching and eviction decisions (compiler-assisted)
- Partial Reuse of Intermediates
  - Problem: Often partial result overlap
  - Reuse partial results via dedicated rewrites (compensation plans)
  - Example: stepIm
- Next Steps: multi-backend, unified mem mgmt

t(X)

## **Recap: Database (Transaction) Log**

#### Database Architecture

- Page-oriented storage on disk and in memory (DB buffer)
- Dedicated eviction algorithms
- Modified in-memory pages marked as dirty, flushed by cleaner thread
- Log: append-only TX changes
- Data/log often placed on different devices and periodically archived (backup + truncate)

## Write-Ahead Logging (WAL)

- The log records of changes to some (dirty) data page must be on stable storage before the data page (UNDO - atomicity)
- Force-log on commit or full buffer (REDO durability)
- Recovery: forward (REDO) and backward (UNDO) processing
- Log sequence number (LSN)

[C. Mohan, Donald J. Haderle, Bruce G. Lindsay, Hamid Pirahesh, Peter M. Schwarz: ARIES: A Transaction Recovery Method Supporting Fine-Granularity Locking and Partial Rollbacks Using Write-Ahead Logging. TODS 1992]

berlin

## **Bitcoin and Blockchain Fundamentals**

#### Motivation

- Peer-to-peer (decentralized, anonymous) electronic cash/payments
- Non-reversible transactions w/o need for trusted third party

## Transaction Overview

- Electronic coin defined as chain of digital signatures
- Transfer by signing hash of previous TX and public key of next owner
- Double-spending problem (without global verification)
- Permissioned/Private Blockchains
  - Blockchain as shared, replicated, permissioned ledger (TX log): consensus, provenance, immutability

## **Blockchain Data Structure**

#### Timestamp Server

■ Decentralized timestamp server: chain of hashes → public ledger

#### Proof-of-Work

- Scanning for value (nonce) whose SHA-256 hash begins with a number of zero bits → exponential in number of zeros
- # zero bits determined by MA of avg blocks/hour
- Hard to recompute for chain, easy to check
- Majority decision: CPU time, longest chain

## Blockchain Data Structure, cont.

- Bitcoin Mining
  - HW: from CPU to GPUs/FPGAs/ASICs (10-70 TH/s @ 2-3KW)
  - Usually mining pools → "mining cartels"
- Hash Rate of Bitcoin Network
  - ~10 min per block (144 blocks per day)

#### @Malaysia

## **Blockchain Consensus Mechanisms**

"means of showing that one invested a non-trivial amount of effort related to some statement"

- Proof of Work (PoW)
  - Validation by performing work, existence of HW resources
  - High HW cost of attacks
  - Wasted work, resources, energy (only first block, no real outcome, e-waste)

## Proof of Stake (PoS)

- Validation by stake-weighted random node selection
- Intrinsic coin cost, less HW resources/energy
- Untested attack mitigation?

## Proof of Space/Capacity

- Upfront creation of "plot files", store nonces+hashes, find solutions, occasional validation
- HW costs of attacks, use of unused space
- Moderate adoption

#### [https://www.chia.net/]

[Stefan Dziembowski, Sebastian Faust, Vladimir Kolmogorov, Krzysztof Pietrzak: Proofs of Space. IACR Cryptol. 2013]

## **Discussion Blockchain**

Recommendation: Investigate business requirements/context, decide on technical properties and acceptable trade-offs

# **Data Catalogs**

## **Recap: Complementary System Architectures**

Horizontal Integration (e.g., EAI)

## **Overview Data Catalogs**

- Data Catalogs
  - Data curation in repositories for finding datasets in data lakes
  - Metadata and provenance
  - Augment data with open and linked data sources

#### Examples

SAP Data Hub

[SAP Sapphire Now 2019]

#### **Google Dataset Search**

[Alon Y. Halevy et al: Goods: Organizing Google's Datasets. **SIGMOD 2016**]

[Dan Brickley, Matthew Burgess, NatashaF. Noy: Google Dataset Search: Building a search engine for datasets in an open Web ecosystem. WWW 2019]

## **GAIA-X Initiative & Integration**

[BMWi: GAIA-X: Driver of digital innovation in Europe – Featuring the next generation of data infrastructure, **2020**]

## **Key Features of a Data Catalog**

#### #1 Dictionary of Datasets

- Basic overview, links, and curation of available datasets
- Raw/original, curated datasets, derived data products

#### #2 Rich Meta Data Collection

- Format, schema, and access information of datasets
- Data profiling, data validation results, and data quality scores

#### #3 Lineage/Provenance

- Coarse or fine-grained lineage, incl applied data integration and cleaning process
- Optionally artifacts to reproduce datasets from sources

#### #4 Data Discovery, Governance, and Sharing

- Find related "joinable" datasets (e.g., over spatial-temporal keys)
- Efficient discovery and sharing of federated data sources

## **Apache Atlas**

#### Apache Atlas Overview

- Metadata management and governance capabilities
- Build catalog (data classification, cross-component lineage)

[https://www.cloudera.com/tutorials/cross-component-lineage-withapache-atlas-across-apache-sqoop-hive-kafka-storm/.html]

## **Summary and Q&A**

- Motivation and Terminology
- Data Provenance
- Data Catalogs

[<u>https://xkcd.com/</u> 2582/]

#### Next Lectures (Large-scale Data Management and Analysis)

- 08 Cloud Computing Fundamentals [Dec 14]
- 09 Cloud Resource Management and Scheduling [Dec 21]
- 10 Distributed Data Storage [Jan 11]
- 11 Distributed, Data-Parallel Computation [Jan 18]
- 12 Distributed Stream Processing [Jan 25]
- 13 Distributed Machine Learning Systems [Feb 01]
